1 The French language

The file `frenchb.dtx`¹, defines all the language definition macros for the French language.

Customisation for the French language is achieved following the book “Lexique des règles typographiques en usage à l’Imprimerie Nationale” troisième édition (1994), ISBN-2-11-081075-0.

First version released: 1.1 (May 1996) as part of Babel-3.6beta. Version 2.0a was released in February 2007 and version 3.0a in February 2014.

**This file `frenchb.dtx` is for LuaTeX,
See file `frenchb3.dtx`
for pdfTeX and XeTeX.**

Significant changes have occurred in version 4.0a, they are listed in subsection 1.4 p. 11.

`babel-french` has been improved using helpful suggestions from many people, mainly from Jacques André, Michel Bovani, Thierry Bouche, Vincent Jalby, Denis Bitouzé, Thomas Savary, Ulrike Fisher and Marcel Krüger. Thanks to all of them! An extensive documentation in French (file `frenchb-doc.pdf`) is now included in `babel-french`.

1.1 Basic interface

In a multilingual document, some typographic rules are language dependent, i.e. spaces before ‘high punctuation’ (‘; ! ?’) in French, others modify the general layout (i.e. layout of lists, footnotes, indentation of first paragraphs of sections) and should apply to the whole document.

The French language can be loaded with Babel by a command like:

`\usepackage[german,spanish,french,british]{babel}`²

`babel-french` takes account of Babel’s *main language* defined as the *last* option at Babel’s loading. When French is not Babel’s main language, `babel-french` does not alter the general layout of the document (even in parts where French is the current language): the layout of lists, footnotes, indentation of first paragraphs of sections are not customised by `babel-french`.

When French is loaded as the last option of Babel, `babel-french` makes the following changes to the global layout, *both in French and in all other languages*³:

1. the first paragraph of each section is indented (LaTeX only);

¹The file described in this section has version number v4.0e and was last revised on 2025-08-15.

²Always use `french` as option name for the French language, former aliases `frenchb` or `francais` are depreciated; expect them to be removed sooner or later!

³For each item, hooks are provided to reset standard LaTeX settings or to emulate the behavior of former versions of `babel-french` (see command `\frenchsetup{}`, section 1.2 p. 5).

2. the default items in itemize environment are set to ‘—’ instead of ‘•’, and all vertical spacing and glue is deleted; it is possible to change ‘—’ to something else (‘–’ for instance) using `\frenchsetup{}` (see section 1.2 p. 5);
3. vertical spacing in general LaTeX lists is shortened;
4. footnotes are displayed “à la française”.

Regarding local typography, the command `\selectlanguage{french}` switches to the French language⁴, with the following effects:

1. French hyphenation patterns are made active;
2. ‘high punctuation’ characters (: ; ! ?) automatically add correct spacing in French; this is achieved using callbacks in Lua(La)TeX, these characters are no longer made “active”;
3. `\today` prints the date in French;
4. the caption names are translated into French (LaTeX only). For customisation of caption names see section 1.2.2 p. 9.
5. the space after `\dots` is removed in French.

Some commands are provided by `babel-french` to make typesetting easier:

1. French quotation marks can be entered using the command `\frquote{}`: `\frquote{some text}` will output « some text ». Former commands `\og` and `\fg` are kept for backward compatibility: `\og some text\fg{}` is an alternative to `\frquote{some text}`.

If French quote characters are available on your keyboard, you can use them, the required nobreak spaces will be added automatically: you can type either « guillemets » or «guillemets»⁵ (with or without spaces) to get properly typeset French quotes. The same is true for the single guillemets `<` and `>`.

For quotations spreading over more than one paragraph, `\frquote` will add at the beginning of every paragraph of the quotation either an opening French guillemet («), or a closing one (») or nothing depending on option `EveryParGuill=open` or `=close` or `=none`, see p. 8.

The command `\NoEveryParQuote` is provided to locally suppress unwanted guillemets (typically when lists are embedded in `\frquote{}`), it is meant to be used inside an environment or a group.

`\frquote` is recommended to enter embedded quotations “à la française”, several variants are provided through options:

- the inner quotation is surrounded by double quotes (“texte”) unless option `InnerGuillSingle=true`, then a) the inner quotation is printed as

⁴`\selectlanguage{francais}` and `\selectlanguage{frenchb}` are no longer supported.

⁵Or even «~guillemets~»...

`<texte>` and b) if the inner quotation spreads over more than one paragraph, every paragraph included in the inner quotation starts with a `<` or `a>` or nothing, depending on option `EveryParGuill=open` (default) or `=close` or `=none`.

- it is possible to add a French opening or closing guillemet (`«` or `»`) at the beginning of every line of the inner quotation using option `EveryLineGuill=open` or `=close`; note that with any of these options, the inner quotation is surrounded by French guillemets (`«` and `»`) regardless option `InnerGuillSingle`; the default is `EveryLineGuill=none`.

A starred variant `\frquote*` is meant for inner quotations which end together with the outer one: using `\frquote*` for the inner quotation will print only one closing quote character (the outer one) as recommended by the French ‘Imprimerie Nationale’.

2. `\frenchdate{<year>}{{<month>}}{<day>}` helps typesetting dates in French: `\frenchdate{2001}{01}{01}` will print 1^{er} janvier 2001 in a box without any linebreak.
3. A command `\up` is provided to typeset superscripts like `M\up{me}` (abbreviation for “Madame”), `1\up{er}` (for “premier”). Other commands are also provided for ordinals: `\ier`, `\iere`, `\iers`, `\ieres`, `\ieme`, `\iemes` (`3\iemes` prints 3^{es}). All these commands take advantage of real superscript letters when they are available in the current font.
4. Command `\bname{}` (boxed name) is provided to typeset family names: its argument will not be hyphenated except on explicit hyphens. `\bsc{}` (boxed small caps) is a variant that prints its argument in small capitals, it is meant for bibliographies, signatures, etc. Usage: `Albert~\bsc{Camus}`.
5. Commands `\primo`, `\secundo`, `\tertio` and `\quarto` print 1^o, 2^o, 3^o, 4^o. `\FrenchEnumerate{6}` prints 6^o.
6. Abbreviations for “Numéro(s)” and “numéro(s)” (N° N^{os} n° and n^{os}) are obtained via the commands `\No`, `\Nos`, `\no`, `\nos`.
7. Two commands `\degre` and `\degres` are provided (for backward compatibility only) to typeset the symbol “degré”. Entering the raw character `°` is easier.
8. In math mode the comma has to be surrounded with braces to avoid a spurious space being inserted after it, in decimal numbers for instance (see the `\TeXbook` p. 134). The command `\DecimalMathComma` makes the comma behave as an ordinary character *when the current language is French* (no space added); as a counterpart, if `\DecimalMathComma` is active, an explicit thin space has to be added in lists and intervals: `$(x,\,y)$`, `$[0,\,1]$`. `\StandardMathComma` switches back to the standard behaviour of the comma in French.

The `icomma` package is an alternative workaround.

9. A command `\nombre` was provided in 1.x versions to easily format numbers in slices of three digits separated either by a comma in English or with a space in French; `\nombre` is now mapped to `\numprint` from `numprint.sty`, which should be loaded *after* Babel, see `numprint.pdf` for more information.
10. `babel-french` has been designed to take advantage of the `xspace` package if present: adding `\usepackage{xspace}` in the preamble will force macros like `\fg`, `\ier`, `\ieme`, `\dots`, ..., to respect the spaces you type after them, for instance typing ‘1`\ier` juin’ will print ‘1^{er} juin’ (no need for a forced space after 1`\ier`).

1.2 Customisation

Customisation of `babel-french` relies on command `\frenchsetup{}` (formerly called `\frenchbsetup{}`, the latter name will be kept for ever to ensure backwards compatibility), options are entered using the 13keys syntax. The command `\frenchsetup{}` is to appear in the preamble only (after loading Babel).

1.2.1 `\frenchsetup{options}`

`\frenchbsetup{}` and `\frenchsetup{}` are synonymous; the latter should be preferred as the language name for French in Babel is no longer `frenchb` but `french`. `\frenchsetup{ShowOptions}` prints all available options to the `.log` file, it is just meant as a remainder of the list of offered options. As usual with 13keys syntax, boolean options (as `ShowOptions`) can be entered as `ShowOptions=true` or just `ShowOptions`, the `=true` part can be omitted.

The other options are listed below. Their default value is shown between braces, sometimes followed be a ‘*’. The ‘*’ means that the default shown applies when `babel-french` is loaded as the *last* option of Babel —Babel’s *main language*—, and is toggled otherwise.

`StandardLayout=true (false*)` forces `babel-french` not to interfere with the layout: no action on any kind of lists, first paragraphs of sections are not indented (as in English), no action on footnotes; it useless unless French is the main language. This option can be used to avoid conflicts with classes or packages which customise lists or footnotes.

`IndentFirst=false (true*)`; set this option to `false` if you do not want `babel-french` to force indentation of the first paragraph of sections. When French is the main language, this option applies to all languages.

`PartNameFull=false (true)`; when true (the default), `babel-french` numbers the title of `\part{}` commands as “Première partie”, “Deuxième partie” and so on. With some classes which change the `\part{}` command (AMS classes do so), you could get “Première partie 1”, “Deuxième partie 2” in the toc; when

this occurs, this option should be set to **false**, part titles will then be printed as “Partie I”, “Partie II”.

TocPartNameFull=false (true*); when true (the default), parts are also numbered “Première partie”, “Deuxième partie”, in the table of contents. This works currently only for the `memoir` and `koma-script` classes (standard classes do not provide any hook to customise the TOC). `babel-french` provides a command `\FBtocpartname{<Romanum>}` which returns the formatted string (“Deuxième partie” if the argument is “II”), it can be used with all classes; it is possible to add something (colon, dot,...) at the end of the string by redefining `\FBtocpartsep: \renewcommand*\{\FBtocpartsep\}{. }` adds a dot.

ListItemsAsPar=true (false) setting this option to **true** is recommended: list items will be displayed as paragraphs with indented labels (in the “Imprimerie Nationale” way) instead of having labels hanging into the left margin. How these two layouts differ is shown below:

<p>Text starting at ‘parindent’ =< Leftmargin — first item running on two lines or more... — first second level item on two lines... — next one... — second item...</p>	<p>Text starting at ‘parindent’ =< Leftmargin — first item running on two lines or more... — first second level item on two lines... — next one... — second item...</p>
Default French layout	With ListItemsAsPar=true

StandardListSpacing=true (false*)⁶; `babel-french` usually customises the vertical spaces in the `list` environment, this affects all lists, including `itemize`, `enumerate`, `description`, but also `abstract`, `quote`, `quotation`, `verse`, etc. which are based on `list`. Setting this option to **true** reverts to the standard settings of the `list` environment as defined by the document class.

StandardItemEnv=true (false*); `babel-french` redefines the `itemize` environment to suppress any vertical space between items of `itemize` lists in French and customises left margins. Setting this option to **true** reverts to the standard definition of `itemize`.

StandardEnumerateEnv=true (false*); `babel-french` redefines `enumerate` and `description` environments to make left margins match those of the French version of `itemize` lists. Setting this option to **true** reverts to the standard definition of `enumerate` and `description`.

StandardItemLabels=true (false*) when set to **true** this option prevents `babel-french` from changing the labels in `itemize` lists in French.

⁶This option should be used instead of former option `ReduceListSpacing` (kept for backward compatibility) which could be misleading: with some classes (`smfart`, `smfbook` f.i.) you had to set `ReduceListSpacing=false` to revert to the class settings which actually reduce list's spacings even more than `babel-french`! `StandardListSpacing=true` replaces `ReduceListSpacing=false`.

`ItemLabels=\textbullet, \textendash, \ding{43}, (\textemdash*)`;
when `StandardItemLabels=false` (the default), this option enables to choose the label used in French `itemize` lists for all levels. The next four options do the same but each one for a specific level only. Note that `\ding{43}` requires loading the `pifont` package.

`ItemLabeli=\textbullet, \textendash, \ding{43} (\textemdash*)`
`ItemLabelii=\textbullet, \textendash, \ding{43} (\textemdash*)`
`ItemLabeliii=\textbullet, \textendash, \ding{43} (\textemdash*)`
`ItemLabeliv=\textbullet, \textendash, \ding{43} (\textemdash*)`

`StandardLists=true (false*)` forbids `babel-french` to customise any kind of list.
The option `StandardLists=true` should be used in case of conflicts with classes or packages that customise lists too. This option is just a shorthand setting all four options `StandardListSpacing=true`, `StandardItemizeEnv=true`, `StandardEnumerateEnv=true` and `StandardItemLabels=true`.

`FrenchFootnotes=false (true*)` reverts to the standard layout of footnotes. By default `babel-french` typesets leading numbers as ‘1.’ instead of ‘1’, but does not change footnotes numbered with symbols (as in the `\thanks` command) or with letters (as in minipages).

`AutoSpaceFootnotes=false (true*)`; by default `babel-french` adds a (customisable) thin space in the running text before the number or symbol calling the footnote. Making this option `false` reverts to the standard setting (no space added). The default definition of this thin space is:
`\newcommand*{\FBfnmarkspace}{\kern .5\fontdimen2\font}`

`AutoSpacePunctuation=false (true)`; with Lua(La)TeX changing this option to `false` doesn’t make sense as the LuaTeX callback takes care of special cases where no space should be added: URLs (`http://mysite`), in MS-DOS paths (`C:\Foo`) or in timetables (10:55). .

`ThinColonSpace=true (false)` changes the non-breaking space added before the colon ‘:’ to a thin space, so that the same amount of space is added before any of the four ‘high punctuation’ characters. The default setting is supported by the French ‘Imprimerie Nationale’.

`OriginalTypewriter=true (false)` prevents any customisation of `\ttfamily` and `\texttt{}` in French. This option should only be used to ensure backward compatibility. The current default behaviour is to switch off any addition of space before high punctuation with typewriter fonts (e.g. `verbatim`).

`UnicodeNoBreakSpaces=true (false)`; (experimental) this option should be set to `true` *only while converting LuaLaTeX files to HTML*. It ensures that non-breaking spaces added by `babel-french` are inserted in the PDF file as U+A0 or U+202F (thin) instead of penalties and glues. Note that `lwrap` (v. 0.37 and up) is fully

compatible with `babel-french` for translating PDFLaTeX or XeLaTeX files to HTML.

`og=<, fg=>`; this option has been kept for backward compatibility but has no effect in Lua(La)TeX, it just prints a warning in the `.log` file.

`INGuillSpace=true (false)` resets the dimensions of spaces after opening French quotes and before closing French quotes to the French ‘Imprimerie Nationale’ standards (inter-word space). `babel-french`’s default setting produces slightly narrower spaces with less stretchability.

`EveryParGuill=open, close, none (open)`; sets whether an opening quote (`<`) or a closing one (`>`) or nothing should be printed by `\frquote{}` at the beginning of every paragraph included in a level 1 (outer) quotation. This option is also considered for level 2 (inner) quotations to decide between `<` and `>` when `InnerGuillSingle=true` (see below).

`EveryLineGuill=open, close, none (none)`; with LuaTeX based engines *only*, it is possible to set this option to `open` [resp. `close`]; this ensures that a ‘`<`’ [resp. ‘`>`] followed by a proper space will be inserted at the beginning of every line of embedded (inner) quotations spreading over more than one line (provided that both outer and inner quotations are entered with `\frquote{}`). When `EveryLineGuill=open` or `=close` the inner quotation is always surrounded by `<` and `>`, the next option is ineffective.

`InnerGuillSingle=true (false)`; if `InnerGuillSingle=false` (the default), inner quotations entered with `\frquote{}` start with ```` and end with `''`. If `InnerGuillSingle=true`, `<` and `>` are used instead of British double quotes; moreover if option `EveryParGuill=open` (or `close`) is set, a `<` (or `>`) is added at the beginning of every paragraph included in the inner quotation.

`ThinSpaceInFrenchNumbers=true (false)`; if `numprint` has been loaded with the `autolanguage` option, while typesetting numbers with the `\numprint{}` command, `\npthousandsep` is defined as a non-breaking space (`\sim`)⁷ in French; when set to true, this option redefines `\npthousandsep` as a thin space (`\FBthinspace`).

`SmallCapsFigTabCaptions=false (true*)`; when set to `false`, `\figurename` and `\tablename` will be printed in French captions as “Figure” and “Table” instead of being printed in small caps (the default). The same result can be achieved by defining `\FBfigtabshape` as `\relax` before loading `babel-french` (in a document class f.i.).

`CustomiseFigTabCaptions=true (false)`; this option is now `false`, as the colon in captions is no printed properly in French with LuaTeX; turning it to `true` prints a warning and changes the caption’s separator into endash to mimic former versions of `babel-french`. Not recommended, see below (section 1.2.3) for hints to customise captions.

⁷Actually without stretch nor shrink.

FrenchSuperscripts=false (true); the babel-french' \up{} command should print better superscripts than \textsuperscript; turning this option to **false** redefines \up{} as \textsuperscript (not recommended, except if \up{} fails).

LowercaseSuperscripts=false (true); by default babel-french inhibits the upercasing of superscripts (for instance when they are moved to page headers). Making this option **false** will disable this behaviour (not recommended).

SUPPRESSWARNING=true (false); can be turned to **true** if you are bored with babel-french's warnings; use this option as *first* option of \frenchsetup{} to cancel warnings launched by other options.

Options' order – Please remember that options are read in the order they appear in the \frenchsetup{} command. Someone wishing that babel-french leaves the layout of lists and footnotes untouched but caring for indentation of first paragraph of sections should choose \frenchsetup{StandardLayout, IndentFirst} The reverse order \frenchsetup{IndentFirst, StandardLayout} would lead to option **IndentFirst** being overwritten by **StandardLayout**.

1.2.2 Caption names

All caption names can easily be customised in French using the simplified syntax introduced by Babel 3.9, for instance \def\frenchproofname{Preuve}. The older syntax \addto\captionsfrench{\def\proofname{Preuve}} still works.

1.2.3 Figure and table captions

Most document classes use a colon as captions' separator in figures and tables like this: 'Figure 1: '. With 8-bits engines (TeX, pdfTeX) the colon was made active too late to ensure a proper space before it. The problem has vanished with LuaTeX. Therefore, the former patches provided in the legacy versions of babel-french have been dropped: \CaptionSeparator is no longer defined and the **CustomiseFigTabCaptions** option is now turned to **false** by default. Switching it to **true**, prints a Warning in the .log file and currently turns the captions' separator into an endash (this might change in the future).

Customisation of the captions' separator should be achieved outside babel-french; here are some hints for those who want to get the endash formerly provided by babel-french:

- with standard classes `article`, `book`, `report`, use `caption.sty`:
`\usepackage[labelsep=endash]{caption}`
- with the `memoir` class, just add:
`\captiondelim{\space\textendash\space}`
- with the koma-script classes, just add:
`\renewcommand{\captionformat}{\space\textendash\space}`

- with the beamer class, just add:
`\setbeamertemplate{caption label separator}{[endash]}`

Following the IN's recommendations, `\figurename` and `\tablename` should be typeset in small caps in French, `babel-french` provides the `SmallCapsFigTabCaptions` option (default is `true`) to do so. It can be set to `false` to typeset `\figurename` and `\tablename` in French as "Figure" and "Table" rather than in small caps (the default).

1.3 Hyphenation checks

Once you have built your format, a good precaution would be to perform some basic tests about hyphenation in French. For LaTeX2e I suggest this:

- run LuaTeX on the following file:

```
%%% Test file for French hyphenation.
\documentclass[french]{article}
\usepackage{fontspec} % mandatory for French
\setmainfont{NewCM10-Book} % or erewhon, XCharter...
\usepackage{babel}
\begin{document}
\showhyphens{signal container événement algèbre}
\end{document}
```

- check the hyphenations proposed by TeX in your log-file; in French you should get
`si-gnal contai-ner évé-ne-ment al-gèbre.`
 Do not care about how accented characters are displayed in the log-file, what matters is the position of the ‘-’ hyphen signs *only*.

If they are all correct, your installation (probably) works fine, if one (or more) is (are) wrong, ask a local wizard to see what's going wrong and perform the test again (or e-mail me about what happens).

Possible mismatches: you get `sig-nal con-tainer`, this probably means that the hyphenation patterns you are using are for US-English, not for French

1.4 Changes

What's new in version 4.0?

`babel-french` has been split into two files `frenchb3.dtx`, the legacy part, which is frozen, is meant for TeX, pdfTeX and XeTeX engines, and `frenchb.dtx` for LuaTeX *only*.

This has made possible to deeply simplify the current file `frenchb.dtx`, stripping old code which no longer makes sense with Lua(La)TeX.

Consequently, some `\frenchsetup{}` options have been modified, deleted or added:

- `AutoPunctuation` should not be turned to `false` with LuaTeX, a warning in `.log` file is issued if you do so; `frenchb.lua` now handles automatically the special cases (2:1, `\http://`, `C:\`, `!!`, etc.) requiring no space before high punctuation.
- `\frenchsetup{og=<, fg=>}` is useless, it just prints a warning; single and double French quotes (`<` and `>`, `<` and `>`) automatically add the required spaces, it is still possible to inhibit this locally using `{\NoAutospacing }`.
- `CustomiseFigTabCaptions` is now `false`, it means that `babel-french` no longer customises the captions' separator (usually a colon); when forced to `true`, it issues a warning and turns the separator to en endash, see section 1.2.3 for better options.
- Options `OldFigTabCaptions`, `ListOldLayout` and `GlobalLayoutFrench` have been deleted (they emulated very old behaviours of `babel-french`).
- a new option `TocPartFullName` has been added to enhance `PartFullName`. When `true` (the default), the numbered parts are printed as “Première partie”, “Deuxième partie” in the table of contents too. This works currently only with the `memoir` and `koma-script` classes.

`frenchb.lua` has a new function `euphonic_t` to deal with compound words' hyphenation like “va-t-on”, “semble-t-il” etc. A bug occurring in case `\spaceskip` is not null has been fixed.

Note on PDF tagging: this project requires a complete redesign of lists based on templates. The new lists templates, still experimental, are incompatible with `babel-french` lists' customisation, which is consequently disabled when tagging is enabled. A warning is issued in the `.log`. See <https://github.com/latex3/tagging-project/issues/694> for more information. I plan to get `babel-french` lists' customisation working again asap (hopefully with the next LaTeX release 2025/10/01).

Version 4.0b takes advantage of the new footnotes' template (when it is available) to customise the footnotes' layout. This should fix issue 932.

Version 4.0: commands `\StandardFootnotes` and `\FrenchFootnotes` have been removed: footnotes inside minipages are now numbered the standard way with both new and old interface.

What's new in version 3.7?

The `acadian` dialect is no longer supported: `\usepackage[acadian]{babel}` prints a warning and uses `french` instead. Reason: I have never got feedback from anybody using them; anyway `babel-french` is customisable enough to fit any French dialect, see `\fbsetup{}` p.[40](#).

Version 3.7 is the frozen version in `frenchb3.dtx`.

What's new in version 3.6?

Version 3.6a no longer loads the `keyval` package, replaced by core LaTeX commands (`13keys`). The thin space added before footnote's calls is now customisable (suggested by Thomas Savary), the command's name is `\FBfnmarkspace`.

2 The code

2.1 Initial setup

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the @ sign, etc.

```
1 <*french>
2 \LdfInit\CurrentOption{FBclean@on@exit}
```

If the engine is not LuaTeX, revert to the version 3.7a of babel-french.

```
3 \let\bb@tempa\relax
4 \begingroup\expandafter\expandafter\expandafter\endgroup
5 \expandafter\ifx\csname luatexversion\endcsname\relax
6   \input french3.1df\relax
7   \let\bb@tempa\endinput
8 \fi
9 \bb@tempa
```

The rest of this file is *only for the Luatex engine*.

Let's provide a substitute for `\PackageError`, `\PackageWarning` and `\PackageInfo` not defined in Plain:

```
10 \def\fb@error#1#2{%
11   \begingroup
12   \newlinechar`\^J
13   \def\\{\^J(french.1df) }%
14   \errhelp{#2}\errmessage{\#1^J}%
15   \endgroup}
16 \def\fb@warning#1{%
17   \begingroup
18   \newlinechar`\^J
19   \def\\{\^J(french.1df) }%
20   \message{\#1^J}%
21   \endgroup}
22 \def\fb@info#1{%
23   \begingroup
24   \newlinechar`\^J
25   \def\\{\^J}%
26   \wlog{\#1}%
27   \endgroup}
```

Quit if the LuaTeX engine is too old.

```
28 \ifnum\luatexversion<100
29   \ifx\PackageWarning@undefined
30     \fb@warning{Please upgrade LuaTeX to version 1.1 or above!}%
31     Aborting.}%
32 \else
33   \PackageWarning{french.1df}{Please upgrade LuaTeX}
```

```

34      to version 1.1 or above!\MessageBreak
35      Aborting. Reported}%
36  \fi
37  \let\bbbl@tempa\endinput
38 \fi
39 \bbbl@tempa

```

Quit if Babel's version is less than 3.9i.

```

40 \let\bbbl@tempa\relax
41 \ifdefined\babelflags
42 \else
43   \let\bbbl@tempa\endinput
44   \ifdefined\PackageError
45     \PackageError{french.ldf}
46     {babel-french requires babel v.24.1.\MessageBreak
47     Aborting here}
48     {Please upgrade Babel!}
49 \else
50   \fb@error{babel-french requires babel v.24.1.\
51             Aborting here}
52             {Please upgrade Babel!}
53 \fi
54 \fi
55 \bbbl@tempa

```

Make sure that `\l@french` is defined (fallbacks are `\l@nohyphenation` if available or 0). `babel.def` (3.9i and up) defines `\l@<languagename>` also for eTeX, LuaTeX and XeTeX formats which set `\lang@<languagename>`.

```

56 \def\FB@nopatterns{%
57   \ifdefined\l@nohyphenation

\iffBFfrench True when the current language is French; will be set to true by `\extrasfrench` and to false by `\noextrasfrench`. Used in `\DecimalMathComma`.

```
82 \newif\iffBFfrench
```

\extrasfrench The macro `\extrasfrench` will perform all the extra definitions needed for the `\noextrasfrench` French language. The macro `\noextrasfrench` is used to cancel the actions of `\extrasfrench`.

In French, character “apostrophe” (U+27 or U+2019) is a letter in expressions like l’ambulance (French hyphenation patterns provide entries for this kind of words). This means that the `\lccode` of “apostrophe” has to be non null in French for proper hyphenation of those expressions, and has to be reset to null when exiting French.

```

2.2 Punctuation

With LuaTeX, callbacks are used to get rid of active punctuation.

\FBguillspace In French high punctuation characters (: ; ! ?) and guillemets require some space to **\FBcolonspace** be added before them (: ; ! ? » ») or after them (« , «). Following the I.N. specifications, **\FBthinspace** the ‘:’ requires an inter-word space before it, the other three require just a thin space. So we define `\FBcolonspace` as `\space` (inter-word space) and `\FBthinspace` as an half inter-word space with no shrink nor stretch. `\FBguillspace` is meant for guillemets; it has been fine tuned by Thierry Bouche to 80% of an inter-word space with reduced stretchability. All three are user customisable in the preamble, best

using the `\FBsetspace` command described below. These three commands are designed for basic French. Other French dialects can use different settings, see below. A penalty will be added before these spaces to prevent line breaking.

```

92 \newcommand*{\FBguillspace}{\hspace{.8\fontdimen2\font
93 plus .3\fontdimen3\font
94 minus .8\fontdimen4\font} \relax}
95 \newcommand*{\FBcolonspace}{\space}
96 \newcommand*{\FBthinspace}{\hspace{.5\fontdimen2\font} \relax}
```

\FBsetspace This command makes it easy to fine tune `\FBguillspace`, `\FBcolonspace` and `\FBthinspace` in French using the optional argument. It is meant for LaTeX2e *only* and can only be used in the preamble. Four mandatory arguments⁸: the first one is a *string* either "guill", "colon", or "thin", the last three are decimal numbers specifying *width*, *stretch* and *shrink* relative to the relevant *fontdimens*. For instance `\FBsetspace{colon}{0.5}{0}{0}` defines `\FBcolonspace` as a thinspace as suggested by the "Guide du typographe Roman".

```

97 \ifLaTeXe
98   \newcommand*{\FBsetspace}[5][french]{%
99     \@namedef{FB#2space}{\hspace{#3\fontdimen2\font
100 plus #4\fontdimen3\font
101 minus #5\fontdimen4\font} \relax}
102   \onlypreamble\FBsetspace
103 \fi
```

We must set the LuaTeX tables for French after possible changes made in the preamble (`\frenchsetup{}` or `\FBsetspace{}`) and before Babel switches to French at `\begin{document}`.

```

104 \ifLaTeXe
105   \AddToHookNext{env/document/before}{%
106     \set@glue@table{colon}%
107     \set@glue@table{thin}%
108     \set@glue@table{guill}%
109   }
110 \fi
```

This code is for Plain: load `ltluatex.tex` if it hasn't been loaded before Babel.

```

111 \ifdefinable\newluafunction{\else
112   \input ltluatex.tex
113 \fi}
```

We define five LuaTeX attributes to control spacing in French for 'high punctuation' and quotes, making sure that `\newattribute` is defined.

`\FB@spacing=0` switches off any space tuning both before high punctuation characters and inside French quotes (i.e. function `french_punctuation` doesn't alter the node list at all).

⁸The former optional `lang` argument no longer has any effect.

\FB@addDPSpace=0 switches off automatic insertion of spaces before high punctuation characters (but typed spaces are still turned into non-breaking thin- or word-spaces). \FB@ucsNBSP triggers the replacement of glues by characters, it is controlled by option **UnicodeNoBreakSpaces**.

```
114  \newattribute\FB@spacing      \FB@spacing=\@ne
115  \newattribute\FB@addDPSpace  \FB@addDPSpace=\@ne
116  \newattribute\FB@ucsNBSP    \FB@ucsNBSP=\z@
```

The next command will be used in the first call of \extrasfrench to convert \FBcolonspace, \FBthinspace and \FBguillspace into a table usable by LuaTeX. This way, any customisation done in the preamble (by \frenchsetup{}, redefinitions or \FBsetspace commands) are taken into account.

In case parsing by the Lua function FBget_glue (defined in file frenchb.lua) fails due to unexpected syntax in \FB... space the table remains unchanged and a warning is issued. The matching space characters for option **UnicodeNoBreakSpaces** are set as word space, thin space or null space according to the *width* parameter.

```
117  \newcommand*\set@glue@table}[1]{%
118  \directlua {
119    local s = token.get_meaning("FB#1space")
120    local t = FBget_glue(s)
121    if t then
122      FBsp.#1.gl = t
123      if FBsp.#1.gl[1] > 0.6 then
124        FBsp.#1.ch = 0xA0
125      elseif FBsp.#1.gl[1] > 0.2 then
126        FBsp.#1.ch = 0x202F
127      else
128        FBsp.#1.ch = 0x200B
129      end
130    else
131      texio.write_nl('term and log', '')
132      texio.write_nl('term and log',
133                  '*** french.ldf warning: Unexpected syntax in FB#1space,')
134      texio.write_nl('term and log',
135                  '*** french.ldf warning: LuaTeX table FBsp unchanged.')
136      texio.write_nl('term and log',
137                  '*** french.ldf warning: Consider using FBsetspace to ')
138      texio.write('term and log', 'customise FB#1space.')
139      texio.write_nl('term and log', '')
140    end
141  }%
142 }
143 </french>
```

frenchb.lua (env.) This is frenchb.lua. It holds Lua code to deal with ‘high punctuation’ and quotes. This code is based on suggestions from Paul Isambert.

First we define two flags to control spacing before French ‘high punctuation’ (thin space or inter-word space).

```
144 <*lua>
145 local FB_punct_thin =
146 {[string.byte("!")] = true,
147 [string.byte("?")] = true,
148 [string.byte(";")] = true}
149 local FB_punct_thick =
150 {[string.byte(":")] = true}
```

Managing spacing for ‘»’ and ‘‹’ (U+203A) can be done by the way; we define two flags, `FB_punct_left` for characters requiring some space before them and `FB_punct_right` for ‘«’ and ‘›’ which must be followed by some space. In case LuaTeX is used to output T1-encoded fonts instead of OpenType fonts, codes `0x13` and `0x14` have to be added for ‘«’ and ‘»’.

```
151 local FB_punct_left =
152 {[string.byte("!")] = true,
153 [string.byte("?")] = true,
154 [string.byte(";")] = true,
155 [string.byte(":")] = true,
156 [0x14] = true,
157 [0xBB] = true,
158 [0x203A] = true}
159 local FB_punct_right =
160 {[0x13] = true,
161 [0xAB] = true,
162 [0x2039] = true}
```

Two more flags will be needed to avoid spurious spaces in strings like !! ?? or (?)

```
163 local FB_punct_null =
164 {[string.byte("!")] = true,
165 [string.byte("?")] = true,
166 [string.byte("[")] = true,
167 [string.byte("(")] = true,
```

or if the user has typed a non-breaking space U+00A0 or U+202F (thin) before a ‘high punctuation’ character: no space should be added by `babel-french`. Same is true inside French quotes.

```
168 [0xA0] = true,
169 [0x202F] = true}
170 local FB_guil_null =
171 {[0xA0] = true,
172 [0x202F] = true}
```

Local definitions for nodes:

```
173 local new_node = node.new
174 local copy_node = node.copy
```

```

175 local node_id      = node.id
176 local HLIST        = node_id("hlist")
177 local TEMP          = node_id("temp")
178 local DISC          = node_id("disc")
179 local KERN          = node_id("kern")
180 local GLUE          = node_id("glue")
181 local GLYPH         = node_id("glyph")
182 local PENALTY       = node_id("penalty")
183 local nobreak       = new_node(PENALTY)
184 nobreak.penalty    = 10000
185 local nbspace       = new_node(GLYPH)
186 local insert_node_before = node.insert_before
187 local insert_node_after  = node.insert_after
188 local remove_node    = node.remove

```

Commands `\FBthinspace`, `\FBcolonspace` and `\FBguillspace` are converted ‘AtBeginDocument’ by the next function `FBget_glue` into tables of three values which are fractions of `\fontdimen2`, `\fontdimen3` and `\fontdimen4`. If parsing fails due to unexpected syntax, the function returns *nil* instead of a table.

```

189 function FBget_glue(toks)
190   local t = nil
191   local f = string.match(toks,
192                         "[^%w]hskip%s*([%d%.]*)%s*[^\n]fontdimen 2")
193   if f == "" then f = 1 end
194   if tonumber(f) then
195     t = {tonumber(f), 0, 0}
196     f = string.match(toks, "plus%s*([%d%.]*)%s*[^\n]fontdimen 3")
197     if f == "" then f = 1 end
198     if tonumber(f) then
199       t[2] = tonumber(f)
200       f = string.match(toks, "minus%s*([%d%.]*)%s*[^\n]fontdimen 4")
201       if f == "" then f = 1 end
202       if tonumber(f) then
203         t[3] = tonumber(f)
204       end
205     end
206   elseif string.match(toks, "[^\n]F?B?thinspace") then
207     t = {0.5, 0, 0}
208   elseif string.match(toks, "[^\n]space") then
209     t = {1, 1, 1}
210   end
211   return t
212 end

```

Let’s initialize the global LuaTeX table `FBsp`: it holds the characteristics of the glues used in French for high punctuation and quotes and the corresponding no-breaking space characters for option `UnicodeNoBreakSpaces`.

```

213 FBsp = {}
214 FBsp.thin = {}
215 FBsp.thin.gl = {.5, 0, 0}
216 FBsp.thin.ch = 0x202F
217 FBsp.colon = {}
218 FBsp.colon.gl = {1, 1, 1}
219 FBsp.colon.ch = 0xA0
220 FBsp.guill = {}
221 FBsp.guill.gl = {.8, .3, .8}
222 FBsp.guill.ch = 0xA0

```

The next function converts the glue table returned by function `FBget_glue` into sp for the current font; beware of null values for fid, see `\nullfont` in TikZ, and of special fonts like `lcircle1.pfb` for which `font.getfont(fid)` does not return a proper font table, in such cases the function returns `nil`. `\spacekip`, when not null, replaces the inter-word space (in `raggedright` env. f.i.). This is now taken into account.

```

223 local font_table = {}
224 local function new_glue_scaled (fid,table)
225   if fid > 0 and table[1] then
226     local fp = font_table[fid]
227     if not fp then
228       local ft = font.getfont(fid)
229       if ft then
230         font_table[fid] = ft.parameters
231         fp = font_table[fid]
232       end
233     end
234     local gl = new_node(GLUE,0)

```

`\spacekip` is usually 0. In some circumstances (`raggedright...`) it gets > 0 and then replaces the inter-word space.

```

235   if fp then
236     local spaceskip
237     spaceskip = tex.get(tex.spacekip)
238     local spskip = spaceskip.width
239     if spaceskip and spskip and spskip > 0 then
240       node.setglue(gl, table[1]*sskip , 0, 0)
241     else
242       node.setglue(gl, table[1]*fp.space,
243                     table[2]*fp.space_stretch,
244                     table[3]*fp.space_shrink)
245     end
246     return gl
247   else
248     return nil
249   end
250 else

```

```

251     return nil
252 end
253 end

```

Let's catch LuaTeX attributes \FB@spacing, \FB@addDPSpace and \FB@addGUILspace.

```

254 local FBspacing    = luatexbase.attributes['FB@spacing']
255 local addDPSpace   = luatexbase.attributes['FB@addDPSpace']
256 local addGUILspace = luatexbase.attributes['FB@addGUILspace']
257 local FBucsNBSP    = luatexbase.attributes['FB@ucsNBSP']
258 local has_attribute = node.has_attribute

```

The following function will be added to kerning callback. It catches all nodes of type GLYPH in the list starting at head and checks the language attributes of the current glyph: nothing is done if the current language is not French and only specific punctuation characters (those for which FB_punct_left or FB_punct_right is true) need a special treatment. In French, local variables are defined to hold the properties of the current glyph (item) and of the previous one (prev) or the next one (next). The FR constant (french) is defined by command \activate@luacode.

```

259 -- Main function (to be added to the kerning callback).
260 local function french_punctuation (head)

```

Restore the built-in kerning for 8-bits fonts.

```

261 node.kerning(head)
262 for item in node.traverse_id(GLYPH, head) do
263     local lang = item.lang
264     local char = item.char

```

Skip glyphs not concerned by French kernings.

```

265     if lang == FR and (FB_punct_left[char] or FB_punct_right[char]) then
266         local fid = item.font
267         local attr = item.attr
268         local FRspacing = has_attribute(item, FBspacing)
269         FRspacing = FRspacing and FRspacing > 0
270         local FRucsNBSP = has_attribute(item, FBucsNBSP)
271         FRucsNBSP = FRucsNBSP and FRucsNBSP > 0
272         if FRspacing and fid > 0 then
273             if FB_punct_left[char] then
274                 local prev = item.prev
275                 local prev_id, prev_subtype, prev_char
276                 if prev then
277                     prev_id = prev.id
278                     prev_subtype = prev.subtype
279                     if prev_id == GLYPH then
280                         prev_char = prev.char
281                     end
282                 end

```

If the previous node is a glue, check its natural width, only positive glues (actually glues > 1 sp, for tabular ‘l’ columns) are to be replaced by a non-breaking space.

```

283         local is_glue = prev_id == GLUE
284         local glue_wd
285         if is_glue then
286             glue_wd = prev.width
287         end
288         local realglue = is_glue and glue_wd > 1

```

For characters for which FB_punct_thin or FB_punct_thick is *true*, the amount of spacing to be typeset before them is controlled by commands \FBthinspace and \FBcolonspace respectively. Two options: if a space has been typed in before (turned into *glue* in the node list), we remove the *glue* and add a nobreak penalty and the required *glue*. Otherwise (auto option), the penalty and the required *glue* are inserted if attribute \FB@addDPspace is set, unless any of these four conditions is met: a) node is ‘:’ and the next one is of type GLYPH (avoids spurious spaces in http://mysite, C:\ or 10:35); b) the previous character is part of type FB_punct_null (avoids spurious spaces in strings like (!) or ??); c) a null glue (actually <= 1 sp for tabulars, possibly < 0) precedes the punctuation character (for tabulars and listings); d) the punctuation character starts a paragraph or an \hbox{ }.

When option **UnicodeNoBreakSpaces** is set to **true**, a Unicode character U+00A0 or U+202F is inserted instead of penalty and glue.

```

289         if FB_punct_thin[char] or FB_punct_thick[char] then
290             local SBDP = has_attribute(item, addDPspace)
291             local auto = SBDP and SBDP > 0
292             if FB_punct_thick[char] and auto then
293                 local next = item.next
294                 local next_id
295                 if next then
296                     next_id = next.id
297                 end
298                 if next_id and
299                     (next_id == GLYPH or next_id == DISC) then
300                     auto = false
301                 end
302             end
303             if auto then
304                 if (prev_char and FB_punct_null[prev_char]) or
305                     (is_glue and glue_wd ≤ 1) or
306                     (prev_id == HLIST and prev_subtype == 3) or
307                     (prev_id == TEMP) then
308                     auto = false
309                 end
310             end
311             local fbgue
312             local t

```

```

313         if FB_punct_thick[char] then
314             t = FBsp.colon.gl
315             nbspace.char = FBsp.colon.ch
316         else
317             t = FBsp.thin.gl
318             nbspace.char = FBsp.thin.ch
319         end
320         fbglue = new_glue_scaled(fid, t)

```

In case `new_glue_scaled` fails (returns nil) the node list remains unchanged.

```

321             if (realglue or auto) and fbglue then
322                 if realglue then
323                     head = remove_node(head,prev,true)
324                 end
325                 if (FRucsNBSP) then
326                     nbspace.font = fid
327                     nbspace.attr = attr
328                     insert_node_before(head,item,copy_node(nbspace))
329                 else
330                     nobreak.attr = attr
331                     fbglue.attr = attr
332                     insert_node_before(head,item,copy_node(nobreak))
333                     insert_node_before(head,item,copy_node(fbglue))
334                 end
335             end

```

Let's consider ‘›’ and ‘⟨’ now (the only remaining glyphs of `FB_punct_left` class): we just have to remove any *glue* possibly preceding them, then to insert the nobreak penalty and the proper *glue* (controlled by `\FBguillspace`). If either a) the preceding glyph is member of `FB_guil_null`, or b) ‘›’/‘⟨’ is the first glyph of an `\hbox{}` or a paragraph, nothing is done, this is controlled by the `addg1` flag.

```

336             else
337                 local addg1 = (prev_char and
338                     not FB_guil_null[prev_char])
339                     or
340                     (not prev_char and
341                         prev_id ~= TEMP and
342                         not (prev_id = HLIST and
343                             prev_subtype = 3)
344                     )

```

Correction for tabular ‘c’ (glue 0 plus 1 fil) and ‘l’ (glue 1sp) columns:

```

345             if is_glue and glue_wd ≤ 1 then
346                 addg1 = false
347             end
348             local t = FBsp.guill.gl
349             nbspace.char = FBsp.guill.ch

```

```

350         local fbglue = new_glue_scaled(fid, t)
351         if addgl and fbglue then
352             if is_glue then
353                 head = remove_node(head,prev,true)
354             end
355             if (FRucsNBSP) then
356                 nbspace.font = fid
357                 nbspace.attr = attr
358                 insert_node_before(head,item,copy_node(nbspace))
359             else
360                 nobreak.attr = attr
361                 fbglue.attr = attr
362                 insert_node_before(head,item,copy_node(nobreak))
363                 insert_node_before(head,item,copy_node(fbglue))
364             end
365         end
366     end

```

Similarly, for ‘‘ or ‘’ (unique members of the FB_punct_right class): unless either a) the next glyph is member of FB_guil_null, or b) ‘‘/‘’ is the last glyph of an \hbox{} or a paragraph (then the addgl flag is false, nothing is done), we remove any *glue* possibly following it and insert first the proper *glue* then a nobreak penalty so that finally the penalty preceeds the *glue*.

```

367         elseif FB_punct_right[char] then
368             local next = item.next
369             local next_id, next_subtype, next_char, nextnext, kern_wd
370             if next then
371                 next_id = next.id
372                 next_subtype = next.subtype

```

In case of coding ‘‘~ or ‘‘~ remove the penalty and the glue:

```

373             if next_id == PENALTY then
374                 nextnext = next.next
375                 if nextnext and nextnext.id == GLUE then
376                     head = remove_node(head,nextnext,true)
377                     head = remove_node(head,next,true)
378                     next = item.next
379                     if next then
380                         next_id = next.id
381                         next_subtype = next.subtype
382                         if next_id == GLYPH then
383                             next_char = next.char
384                         end
385                     end
386                 end
387             end

```

A kern0 might hide a penalty and/or glue, so look ahead if next is a kern (this occurs with « \texttt{a} » and «~\texttt{a}~»):

```

388         if next_id == KERN then
389             kern_wd = next.kern
390             if kern_wd == 0 then
391                 nextnext = next.next
392                 if nextnext then
393                     next = nextnext
394                     next_id = nextnext.id
395                     next_subtype = nextnext.subtype
396                     if next_id == PENALTY then
397                         nextnext = next.next
398                         if nextnext and nextnext.id == GLUE then
399                             head = remove_node(head,next,true)
400                             head = remove_node(head,nextnext,true)
401                             next = item.next
402                             if next then
403                                 next_id = next.id
404                                 next_subtype = next.subtype
405                             end
406                         end
407                     end
408                 end
409             end
410             if next_id == GLYPH then
411                 next_char = next.char
412             end
413         end
414     end
415     local is_glue = next_id == GLUE
416     if is_glue then
417         glue_wd = next.width
418     end

```

The addgl flag only depends on next_char and is_glue:

```

419         local addgl = (next_char and not FB_guil_null[next_char])
420             or (next and not next_char)

```

Correction for tabular ‘c’ columns. For ‘r’ columns, a final ‘‘’ character needs to be coded as \mbox{“} for proper spacing (\NoAutoSpacing is another option).

```

421         if is_glue and glue_wd == 0 then
422             addgl = false
423         end
424         local fid = item.font
425         local t = FBsp.guill.gl
426         nbspace.char = FBsp.guill.ch
427         local fbglue = new_glue_scaled(fid, t)

```

```

428         if addgl and fbglue then
429             if is_glue then
430                 head = remove_node(head,next,true)
431             end
432             if (FRucsNBSP) then
433                 nbspace.font = fid
434                 nbspace.attr = attr
435                 insert_node_after(head, item, copy_node(nbspace))
436             else
437                 nobreak.attr = attr
438                 fbglue.attr = attr
439                 insert_node_after(head, item, copy_node(fbglue))
440                 insert_node_after(head, item, copy_node(nobreak))
441             end
442         end
443     end
444   end
445 end
446 end
447 return head
448end

```

This function deals with hyphenation of the euphonic-t in French: strings like “a-t-il”, “dira-t-elle”, “va-t-on”, “semble-t-il”, etc. may be hyphenated on the first ‘-’, never on the second one. It increases the hyphen penalty to 10000 on the second ‘-’.

```

449 local FB_t =
450 {[0x74]           = true,
451 [0x54]           = true}
452 local function euphonic_t (head)
453   for item in node.traverse_id(DISC, head) do
454     if item.subtype = 2 then
455       local next = item.next
456       local lang
457       local nnnext
458       if next and next.id = GLYPH and FB_t[next.char] then
459         lang = next.lang
460         nnnext = next.next
461       end
462       if lang = FR and nnnext and
463           nnnext.id = DISC and nnnext.subtype = 2 then
464             nnnext.penalty = 10000
465       end
466     end
467   end
468   return head
469end
470return french_punctuation, euphonic_t

```

```
471 </lua>
```

As a language tag is part of glyph nodes in LuaTeX, no more switching has to be done in `\extrasfrench`.

The next definition will be used to activate Lua punctuation: it loads `frenchb.lua` and adds function `french_punctuation` to the `kerning` callback; "adding" anything actually disables the built-in kerning for Type1 fonts (which is now added to `french_punctuation`).

```
472 <*french>
473 \def\activate@luacode{%
474   \directlua{%
475     FR = \the\l@french ;
476     local path = kpse.find_file("frenchb.lua", "lua")
477     if path then
478       local f1, f2 = dofile(path)
479       luatexbase.add_to_callback("kerning",
480         f1, "frenchb.french_punctuation")
481       luatexbase.add_to_callback("pre_linebreak_filter",
482         f2, "frenchb.euphonic_t")
483     else
484       texio.write_nl('')
485       texio.write_nl('*****')
486       texio.write_nl('Error: frenchb.lua not found.')
487       texio.write_nl('*****')
488       texio.write_nl('')
489     end
490   }%
491 }
```

A new 'if' `\ifFBAutoSpacePunctuation` needs to be defined now to control the two possible ways of dealing with 'high punctuation'. It's default value is true, but it can be set to false by `\frenchsetup{AutoSpacePunctuation=false}` for finer control.

```
492 \newif\ifFBAutoSpacePunctuation \FBAutoSpacePunctuationtrue
```

`\AutoSpaceBeforeFDP` `\autospace@beforeFDP` and `\noautospace@beforeFDP` are internal commands.
`\NoAutoSpaceBeforeFDP` `\autospace@beforeFDP` sets LuaTeX attribute `\FB@addDPSpace` to 1 (true), while `\noautospace@beforeFDP` sets flag `\FB@addDPSpace` to 0 (false). User commands `\AutoSpaceBeforeFDP` and `\NoAutoSpaceBeforeFDP` do the same and take care of the flag `\ifFBAutoSpacePunctuation` in LaTeX.

Set the default now for Plain (done later for LaTeX).

```
493 \def\autospace@beforeFDP{\FB@addDPSpace=\@ne \relax}
494 \def\noautospace@beforeFDP{\FB@addDPSpace=\z@ \relax}
495 \ifLaTeXe
496   \def\AutoSpaceBeforeFDP{\autospace@beforeFDP
497                           \FBAutoSpacePunctuationtrue}
498 \def\NoAutoSpaceBeforeFDP{\noautospace@beforeFDP}
```

```

499                               \FBAutoSpacePunctuationfalse}
500   \AtEndOfPackage{\AutoSpaceBeforeFDP}
501 \else
502   \let\AutoSpaceBeforeFDP\autospace@beforeFDP
503   \let\NoAutoSpaceBeforeFDP\noautospace@beforeFDP
504   \AutoSpaceBeforeFDP
505 \fi

```

\rmfamilyFB In LaTeXe `\ttfamily` (and hence `\texttt`) will be redefined ‘`AtBeginDocument`’ as **\sffamilyFB** `\ttfamilyFB` so that no space is added before the four ; : ! ? characters, even if `\ttfamilyFB` `AutoSpacePunctuation` is **true**. When `AutoSpacePunctuation` is **false**, the eventually typed spaces are left unchanged (not turned into thin spaces, no penalty added). `\rmfamily` and `\sffamily` need to be redefined also (`\ttfamily` is not always used inside a group, its effect can be cancelled by `\rmfamily` or `\sffamily`). These redefinitions can be canceled if necessary, for instance to recompile older documents, see option `OriginalTypewriter` below.

To be consistent with what is done for the ; : ! ? characters, `\ttfamilyFB` also switches off insertion of spaces inside French guillemets. This is also a workaround for the weird behaviour of these characters in verbatim mode.

```

506 \ifLaTeXe
507   \NewDocumentCommand\ttfamilyFB{}{\FB@spacing=\z@ \ttfamilyORI}
508   \NewDocumentCommand\rmfamilyFB{}{\FB@spacing=\@ne \rmfamilyORI}
509   \NewDocumentCommand\sffamilyFB{}{\FB@spacing=\@ne \sffamilyORI}
510 \fi

```

\NoAutoSpacing The following command disables automatic spacing for high punctuation and French quote characters. It is meant to be used inside a group. `\NoAutoSpacing` must be inhibited in bookmarks. The faked definition of `\texorpdfstring` will be overwritten by `hyperref.sty`.

```

511 \providecommand\texorpdfstring[2]{#1}
512 \DeclareRobustCommand{\NoAutoSpacing}{%
513   \texorpdfstring{\FB@spacing=\z@}{}
514 }

```

2.3 Commands for French quotation marks

`\guillemotleft` We provide the following definitions for non-LaTeX users only as fall-back, they are `\guillemotright` welcome to change them for anything better.

```

\guilsinglleft 515 \ifLaTeXe
\guilsinglright 516 \else
\textquotedblleft 517 \def\guillemotleft{{\char"00AB}}
\textquotedblright 518 \def\guillemotright{{\char"00BB}}
519 \def\textquotedblleft{{\char"201C}}
520 \def\textquotedblright{{\char"201D}}

```

```

521 \def\guilsinglleft{{\char"2029}}
522 \def\guilsinglright{{\char"203A}}
523 \let\xspace\relax
524 \fi

```

\og The user level macros for quotation marks are named `\og` (“ouvrez guillemets”) and **\fg** (fermez guillemets). They are kept for backward compatibility only, as typing in « and » is much easier. Another option for typesetting quotes in French is to use the command `\frquote` (see below). If the current language is not French, `\og` and `\fg` provide default (English) quotes.

```

525 \newcommand*{\og}{\textquotedblleft}
526 \newcommand*{\fg}{%
527   \texorpdfstring{\ifdim\lastskip>\z@\unskip\fi\textquotedblright\xspace}{%
528     \textquotedblright\xspace}%
529 }

```

The definitions of `\og` and `\fg` for quotation marks are switched on and off through the `\extrasfrench` `\noextrasfrench` mechanism. Outside French, `\og` and `\fg` will typeset standard English opening and closing double quotes. We’ll try to be smart to users of David Carlisle’s `xspace` package: if this package is loaded there will be no need for {} or `\` to get a space after `\fg`, otherwise `\xspace` will be defined as `\relax` (done at the end of this file).

```

530 \newcommand*{\FB@og}{\texorpdfstring{\guillemotleft}{%
531   \guillemotleft\space}%
532 \newcommand*{\FB@fg}{\texorpdfstring{\ifdim\lastskip>\z@\unskip\fi}{%
533   \guillemotright\{\space\guillemotright\}}%
534 \def\bb@frenchguillemets{\def\og{\FB@og}%
535   \def\fg{\FB@fg\xspace}%
536 \addto\extrasfrench{\babel@save\og \babel@save\fg}{%
537   \bb@frenchguillemets}

```

\frquote Another way of entering French quotes relies on `\frquote{}` with supports up to two levels of quotes. Let’s define the default quote characters to be used for level one or two of quotes...

```

538 \newcommand*{\@ogi}{\ifmmode\hbox{\guillemotleft}\else\guillemotleft\fi}
539 \newcommand*{\@fgi}{\ifmmode\hbox{\guillemotright}\else\guillemotright\fi}
540 \newcommand*{\ogii}{\ifFBInnerGuillSingle \guilsinglleft
541   \else \textquotedblleft
542   \fi}
543 \newcommand*{\fgii}{\ifFBInnerGuillSingle \guilsinglright
544   \else \textquotedblright
545   \fi}
546 \newcommand*{\@ogii}{\ifmmode\hbox{\ogii}\else\ogii\fi}
547 \newcommand*{\@fgii}{\ifmmode\hbox{\fgii}\else\fgii\fi}

```

and the needed technical stuff to handle options:

```

548 \newcount\FBguill@level
549 \newtoks\FBold@everypar
\FB@addquote@everypar was borrowed from csquotes.sty.
550 \def\FB@addquote@everypar{%
551   \let\FBnew@everypar\everypar
552   \FBold@everypar=\expandafter{\the\everypar}%
553   \FBnew@everypar={\the\FBold@everypar\FBeverypar@quote}%
554   \let\everypar\FBold@everypar
555   \let\FB@addquote@everypar\relax
556 }
557 \newif\iffBcloseguill \FBcloseguilltrue
558 \newif\iffBInnerGuillSingle
559 \def\FBguillopen{\guillemotleft}
560 \def\FBguillclose{\guillemotright}
561 \let\FBguillnone\empty
562 \let\FBeveryparguill\FBguillopen
563 \let\FBeverylineguill\FBguillnone
564 \let\FBeverypar@quote\relax
565 \let\FBeveryline@quote\empty

```

The main command `\frquote` accepts (in LaTeX2e only) a starred version which suppresses the closing quote; it is meant to be used for inner quotations which end together with the outer one, then only one closing guillemet (the outer one) should be printed. `\frquote` (without star) is now designed to work in bookmarks too.

```

566 \ifLaTeXe
567   \DeclareRobustCommand\frquote{%
568     \texorpdfstring{@ifstar{\FBcloseguillfalse\fr@quote}{%
569       {\FBcloseguilltrue \fr@quote}}}{%
570       {\bm@fr@quote}}}
571   }
572   \newcommand{\bm@fr@quote}[1]{« #1 »}
573 \else
574   \newcommand\frquote[1]{\fr@quote{#1}}
575 \fi

```

The internal command `\fr@quote` takes one (long) argument: the quotation text.

```

576 \newcommand{\fr@quote}[1]{%
577   \leavevmode
578   \advance\FBguill@level by \@ne
579   \ifcase\FBguill@level
580     \or

```

This for level 1 (outer) quotations: set `\FBeverypar@quote` for level 1 quotations and add it to `\everypar` using `\FB@addquote@everypar`, then print the quotation:

```

581   \ifx\FBeveryparguill\FBguillnone
582   \else
583     \def\FBeverypar@quote{\FBeveryparguill}%

```

```

584      \FB@addquote@everypar
585      \fi
586      \@ogi #1\@fgi
587  \or

```

This for level 2 (inner) quotations: Omega's command `\localleftbox` included in LuaTeX, is convenient for repeating guillemets at the beginning of every line.

```

588  \ifx\FBeverystartguill\FBguillopen
589    \def\FBeverystart@quote{\guillemotleft\FBguillspace}%
590    \localleftbox{\FBeverystart@quote}%
591    \let\FBeverypar@quote\relax
592    \@ogi #1\ifFBcloseguill\@fgi\fi
593  \else
594    \ifx\FBeverystartguill\FBguillclose
595      \def\FBeverystart@quote{\guillemotright\FBguillspace}%
596      \localleftbox{\FBeverystart@quote}%
597      \let\FBeverypar@quote\relax
598      \@ogi #1\ifFBcloseguill\@fgi\fi
599  \else

```

otherwise we eventually need to redefine `\FBeverypar@quote` for level 2 quotations:

```

600    \let\FBeverypar@quote\relax
601    \iffBInnerGuillSingle
602      \ifx\FBeveryparguill\FBguillopen
603        \def\FBeverypar@quote{\guilsinglleft\FBguillspace}%
604      \fi
605      \ifx\FBeveryparguill\FBguillclose
606        \def\FBeverypar@quote{\guilsinglright\FBguillspace}%
607      \fi
608    \fi
609    \@ogii #1\@fgii
610  \fi
611  \fi
612 \else

```

Warn if `\FBguill@level > 2`:

```

613  \ifx\PackageWarning@\undefined
614    \fb@warning{\noexpand\frquote\space handles up to
615                two levels.\`{ } Quotation not printed.}%
616  \else
617    \PackageWarning{french.ldf}{%
618      \protect\frquote\space handles up to two levels.
619      \MessageBreak Quotation not printed. Reported}
620  \fi
621 \fi

```

Closing: step down `\FBguill@level` and clean on exit. Changes made global in case `\frquote{}` ends inside an environment.

```

622 \global\advance\FBguill@level by \m@ne
623 \ifcase\FBguill@level \global\let\FBeverypar@quote\relax
624 \or \gdef\FBeverypar@quote{\FBeveryparguill}%
625 \global\let\FBeveryline@quote\empty
626 \ifx\FBeverylineguill\FBguillnone\else\localleftbox{}\fi
627 \fi
628 }

```

The next command is intended to be used in list environments to suppress quotes which might be added by \FBeverypar@quote after items for instance.

```
629 \newcommand*{\NoEveryParQuote}{\let\FBeveryparguill\FBguillnone}
```

2.4 Date in French

\frenchtoday The following code creates a macro \datefrench which in turn defines command \frenchdate \frenchtoday (\today is defined as \frenchtoday in French). This new implementation relies on commands \SetString and \SetStringLoop, therefore requires Babel 3.10 or newer.

```

630 \StartBabelCommands*{french}{date}
631   [unicode, fontenc=TU EU1 EU2, charset=utf8]
632   \SetStringLoop{month#1name}{%
633     janvier,février,mars,avril,mai,juin,juillet,%
634     août,septembre,octobre,novembre,décembre}
635   \SetString\today{\FB@date{\year}{\month}{\day}}
636 \EndBabelCommands

```

\frenchdate (which produces an unbreakable string) and \frenchtoday (breakable) both rely on \FB@date, the inner group is needed for \hbox.

```

637 \newcommand*{\FB@date}[3]{%
638   {{\number#3}\ifnum1=#3{\ier}\fi\FBdatespace
639   \csname month\romannumerical#2name\endcsname
640   \ifx#1\empty\else\FBdatespace\number#1\fi}}
641 \newcommand*{\FBdatebox}{\hbox}
642 \newcommand*{\FBdatespace}{\space}
643 \newcommand*{\frenchdate}{\FBdatebox\FB@date}

```

2.5 Extra utilities

Let's provide the French user with some extra utilities.

\up \up eases the typesetting of superscripts like '1^{er}.

\fup When a font has built-in superscripts, the best thing to do is to just use them, otherwise \fup provides an alternative which typesets superscripts slightly smaller and higher. Scaling is done using package `scalefnt` which will be loaded at the end of Babel's loading (babel-french being an option of Babel, it cannot load a package while being read).

Options **FrenchSuperscripts** and **LowercaseSuperscripts** will be processed in **\FBprocess@options** to choose which version of **\up{}** will be used in the document.

```
644 \newif\iffBFFrenchSuperscripts      \FBFrenchSuperscriptstrue
645 \newif\iffBLLowercaseSuperscripts    \FBLowercaseSuperscriptstrue
646 \newdimen\FB@Mht
647 \ifLaTeXe
648   \AtEndOfPackage{\RequirePackage{scalefnt}}
```

\fup holds the definition of fake superscripts. The scaling ratio is 0.65, raising is computed to put the top of lower case letters (like ‘m’) just under the top of upper case letters (like ‘M’), precisely 12% down. These settings look correct for most fonts, but can be tuned by the end-user if necessary by changing **\FBsupR** and **\FBsupS** commands.

\FB@lc is defines as **\MakeLowercase** to inhibit the uppercasing of superscripts (this may happen in page headers with the standard classes but is wrong); **\FB@lc** can be redefined to do nothing using option **LowercaseSuperscripts=false** of **\frenchsetup{}**.

```
649 \newcommand*\FBsupR{-0.12}
650 \newcommand*\FBsupS{0.65}
651 \newcommand*\FB@lc[1]{\MakeLowercase{#1}}
652 \NewDocumentCommand\fup{ m }{%
653   \settoheight{\FB@Mht}{M}%
654   \addtolength{\FB@Mht}{\FBsupR \FB@Mht}%
655   \addtolength{\FB@Mht}{-\FBsupS ex}%
656   \raisebox{\FB@Mht}{\scalefont{\FBsupS}{\FB@lc{#1}}}%
657 }
```

Poor man’s definition of **\up** for Plain.

```
658 \else
659   \providecommand*\up[1]{\leavevmode\raise1ex\hbox{\sevenrm #1}}
660 \fi
```

\ieme Some handy macros for those who don’t know how to abbreviate ordinals:

```
\ier 661 \def\ieme{\up{e}\xspace}
\iere 662 \def\iemes{\up{es}\xspace}
\iemes 663 \def\ier{\up{er}\xspace}
\iers 664 \def\iers{\up{ers}\xspace}
\ieres 665 \def\iere{\up{re}\xspace}
\ieres 666 \def\ieres{\up{res}\xspace}
```

\FBmedkern Configurable kerns **\FBmedkern**, and **\FBthickkern** suitable for HTML translation.

```
\FBthickkern 667 \newcommand*\FBmedkern{\kern+.2em}
668 \newcommand*\FBthickkern{\kern+.3em}
```

\primo Some support macros relying on **\up** for numbering, safe in bookmarks:

```
\fprimo) 669 \newcommand*\FrenchEnumerate[1]{%
\nos 670   #1\textrorpdfstring{\up{o}}{\FBthickkern}{\textdegree\space}}
\Nos
\No
\no
```

```

671 \newcommand*\{\\FrenchPopularEnumerate}[1]{%
672     #1\\texorpdfstring{\\up{o}}\\FBthickkern}\\textdegree\\space}

```

Typing `\primo` should result in ‘^o’ (except in bookmarks where `\textdegree` is used instead of o-superior),

```

673 \\def\\primo{\\FrenchEnumerate1}
674 \\def\\secundo{\\FrenchEnumerate2}
675 \\def\\tertio{\\FrenchEnumerate3}
676 \\def\\quarto{\\FrenchEnumerate4}

```

while typing `\fprimo` gives ‘^o’ (except in bookmarks where `\textdegree` is used instead),.

```

677 \\def\\fprimo{\\FrenchPopularEnumerate1}
678 \\def\\fsecundo{\\FrenchPopularEnumerate2}
679 \\def\\ftertio{\\FrenchPopularEnumerate3}
680 \\def\\fquarto{\\FrenchPopularEnumerate4}

```

Let’s provide four macros for the common abbreviations of “Numéro”. In bookmarks ‘^o’ is used instead of o-superior.

```

681 \\DeclareRobustCommand*{\\No}{%
682     \\texorpdfstring{N\\up{o}}\\FBmedkern}\\textdegree\\space}
683 \\DeclareRobustCommand*{\\no}{%
684     \\texorpdfstring{n\\up{o}}\\FBmedkern}\\textdegree\\space}
685 \\DeclareRobustCommand*{\\Nos}{%
686     \\texorpdfstring{N\\up{os}}\\FBmedkern}\\textdegree\\space}
687 \\DeclareRobustCommand*{\\nos}{%
688     \\texorpdfstring{n\\up{os}}\\FBmedkern}\\textdegree\\space}

```

\bname These commands are meant to easily enter family names (in small capitals for the **\bsc** latter) while avoiding hyphenation. A `\kern0pt` is used instead of `\mbox` because `\mbox` would break microtype’s font expansion; as a positive side effect, composed names (such as Dupont-Durand) can now be hyphenated on explicit hyphens.

```

689 \\ifLaTeXe
690   \\DeclareRobustCommand*{\\bname}[1]{%
691     \\texorpdfstring{\\leavevmode\\begingroup\\kern0pt #1\\endgroup}\\#1}%
692   }
693 \\DeclareRobustCommand*{\\bsc}[1]{%
694     \\texorpdfstring{\\leavevmode\\begingroup\\kern0pt \\scshape #1\\endgroup}\\%
695     \\textsc{\\#1}}%
696   }
697 \\else
698   \\newcommand*{\\bname}[1]{\\leavevmode\\begingroup\\kern0pt #1\\endgroup}
699   \\let\\bsc\\bname
700 \\fi

```

Some definitions for special characters. We won’t define `\tilde` as a Text Symbol not to conflict with the macro `\tilde` for math mode and use the name `\tild` instead.

Note that `\boi` may *not* be used in math mode, its name in math mode is `\backslash`. `\degree` can be accessed by the command `\r{}` for ring accent.

```

701 \providecommand*{\textbackslash}{\char"005C}
702 \providecommand*{\textasciicircum}{\char"005E}
703 \providecommand*{\textasciitilde}{\char"007E}
704 \providecommand*{\degree}{\circ}
705 \providecommand*{\degrees}{\circ}
706 \providecommand*{\boi}{\textbackslash}
707 \providecommand*{\circonflexe}{\textasciicircum}
708 \providecommand*{\tild}{\textasciitilde}
709 \newcommand*{\at}{@}

```

2.6 Formatting numbers

`\StandardMathComma` As mentioned in the *TeXbook* p. 134, the comma is of type `\mathpunct` in math mode;
`\DecimalMathComma` it is automatically followed by a thin space. This is convenient in lists and intervals
but unpleasant when the comma is used as a decimal separator in French: it has to
be entered as `{,}`. `\DecimalMathComma` makes the comma be an ordinary character
(of type `\mathord`) in French *only* (no space added); `\StandardMathComma` switches
back to the standard behaviour of the comma.

Unfortunately, `\newcount` inside `\if` breaks Plain formats.

```

710 \newif\iffFB@icomma
711 \newcount\mc@charclass
712 \newcount\mc@charfam
713 \newcount\mc@charslot
714 \newcount\std@mcc
715 \newcount\dec@mcc
716   \mc@charclass=\Umathcharclass`|,
717   \newcommand*{\dec@math@comma}{%
718     \mc@charfam=\Umathcharfam`|,
719     \mc@charslot=\Umathcharslot`|,
720     \Umathcode`\",= 0 \mc@charfam \mc@charslot
721   }
722   \newcommand*{\std@math@comma}{%
723     \mc@charfam=\Umathcharfam`|,
724     \mc@charslot=\Umathcharslot`|,
725     \Umathcode`\",= \mc@charclass \mc@charfam \mc@charslot
726   }
727 \let\dec@m@c\relax

```

If `\DecimalMathComma` is issued in the document body (when the current language is French) its effect will survive to a language switch, unless issued inside a group (see `\dec@m@c`'s expansion). The `icomma` inhibits `\DecimalMathComma`.

```

728 \newif\if@FBpreamble
729 \ifLaTeXe \@FBpreambletrue \fi

```

```

730 \newif\if@preamble@DecimalMathComma
731 \newcommand*{\DecimalMathComma}{%
732   \if@FBpreamble \@preamble@DecimalMathCommatrue
733   \else
734     \iffB@icomma
735       \PackageWarning{french.ldf}{%
736         icomma package loaded, \protect\DecimalMathComma\MessageBreak
737         does nothing. Reported}%
738   \else
739     \iffBFfrench
740       \dec@math@comma
741       \let\dec@m@c\dec@math@comma
742       \expandafter\addto\csname extras\languagename\endcsname
743         {\dec@m@c}%
744     \fi
745   \fi
746 \fi
747 }
748 \newcommand*{\StandardMathComma}{%
749   \iffB@icomma
750     \PackageWarning{french.ldf}{%
751       icomma package loaded, \protect\StandardMathComma\MessageBreak
752       does nothing. Reported}%
753   \else
754     \iffBFfrench
755       \std@math@comma
756       \let\dec@m@c\relax
757     \fi
758 \fi
759 }

```

This is for Plain formats *only* (see below).

```

760 \ifLaTeXe\else
761   \addto\noextrasfrench{\std@math@comma}
762 \fi

```

Fake command `\nombre` for Plain based formats, warning users of `babel-french` v. 1.x. about the change:

```

763 \newcommand*{\nombre}[1]{{#1}}\fb@warning{*** \noexpand\nombre
764                               no longer formats numbers\string! ***}%

```

Let's activate LuaTeX punctuation if necessary (LaTeX or Plain) so that `\FBsetspace` commands can be used in the preamble, then cleanup and exit without loading any `.cfg` file in case of Plain formats.

```

765 \activate@luacode
766 \let\FBstop@here\relax
767 \def\FBclean@on@exit{%

```

```

768 \let\ifLaTeXe\iffalse
769 \let\LaTeXetrue\undefined
770 \let\LaTeXefalse\undefined
771 \let\FB@llc\loadlocalcfg
772 \let\loadlocalcfg@gobble}
773 \ifx\magnification@\undefined
774 \else
775   \def\FBstop@here{%
776     \FBclean@on@exit
777     \l df@finish\CurrentOption
778     \let\loadlocalcfg\FB@llc
779     \endinput}
780 \fi
781 \FBstop@here

```

What follows is for LaTeX2e *only*: the next piece of code would break Plain formats. If issued in the preamble, `\DecimalMathComma` works globally on all parts of the document that are typeset in a French. Can be canceled anytime by `\StandardMathComma`.

```

782 \AddToHookNext{env/document/before}{%
783   @FBpreamblefalse
784   \IfPackageLoadedTF{icomma}{%
785     {\FB@icommatrue
786       \if@preamble@DecimalMathComma
787         \FBWarning{icomma package loaded, \protect\DecimalMathComma%
788           \MessageBreak does nothing. Reported}%
789       \fi
790     }%
791     {\if@preamble@DecimalMathComma
792       \ifFB@mainlanguage@FR \dec@math@comma \fi
793       \let\dec@m@c\dec@math@comma
794       \addto\extrasfrench{\dec@m@c}%
795     \fi
796     \addto\noextrasfrench{\std@math@comma}%
797   }%
798 }

```

The comma is reset to type `\mathpunct` when leaving French (only if the `icomma` package is not loaded).

```

796   \addto\noextrasfrench{\std@math@comma}%
797 }%
798 }

```

nombre We redefine `\nombre` for LaTeX2e. The command `\nombre` is now borrowed from `numprint.sty` for LaTeX2e. There is no point to maintain the former tricky code when a package is dedicated to do the same job and more. A warning is issued at the first call of `\nombre` if `\numprint` is not defined, suggesting what to do. The package `numprint` is *not* loaded automatically by `babel-french` because of possible options conflict.

```

799 \renewcommand*{\nombre}[1]{\Warning@nombre{#1}}
800 \newcommand*{\Warning@nombre}[1]{%

```

```

801 \ifdefined\numprint
802   \numprint{#1}%
803 \else
804   \FBWarning{%
805     \protect\nombre\space now relies on package numprint.sty,%
806     \MessageBreak add \protect
807     \usepackage[autolanguage]{numprint}, \MessageBreak
808     see file numprint.pdf for more options. \MessageBreak
809     \protect\nombre\space called}%
810   \global\let\Warning@nombre\relax
811   {#1}%
812 \fi
813 }

814 \newcommand*{\FBthousandsep}{\kern \fontdimen2\font \relax}

```

2.7 Caption names

The next step consists in defining the French equivalents for the LaTeX caption names.
New implementation for caption names (requires Babel's 3.10 or newer).

```

815 \StartBabelCommands*{french}{captions}
816   [unicode, fontenc=TU EU1 EU2, charset=utf8]
817   \SetString{\refname}{Références}
818   \SetString{\abstractname}{Résumé}
819   \SetString{\bibname}{Bibliographie}
820   \SetString{\chaptername}{Chapitre}
821   \SetString{\prefacename}{Préface}
822   \SetString{\appendixname}{Annexe}
823   \SetString{\contentsname}{Table des matières}
824   \SetString{\listfigurename}{Table des figures}
825   \SetString{\listtablename}{Liste des tableaux}
826   \SetString{\indexname}{Index}
827   \SetString{\glossaryname}{Glossaire}
828   \SetString{\figurename}{Figure}
829   \SetString{\tablename}{Table}
830   \SetString{\pagename}{page}
831   \SetString{\seename}{voir}
832   \SetString{\alsofname}{voir aussi}
833   \SetString{\enclname}{P.-J. }
834   \SetString{\ccname}{Copie à }
835   \SetString{\headtoname}{}
836   \SetString{\proofname}{Démonstration}
837   \SetString{\partnameord}{partie}
838   \SetString{\partfirst}{Première}
839   \SetString{\partsecond}{Deuxième}

```

When **PartNameFull=true** (default), `\part{}` is printed in French as “Première partie” instead of “Partie I”. As logic is prohibited inside `\SetString`, let’s hide the test about **PartNameFull** in `\FB@partname`.

```

840  \SetStringLoop{ordinal#1}{%
841      \frenchpartfirst,\frenchpartsecond,Troisième,Quatrième,%
842      Cinquième,Sixième,Septième,Huitième,Neuvième,Dixième,Onzième,%
843      Douzième,Treizième,Quatorzième,Quinzième,Seizième,%
844      Dix-septième,Dix-huitième,Dix-neuvième,Vingtième}
845  \AfterBabelCommands{%
846      \NewDocumentCommand\FB@emptypart{}{\def\thepart{\unskip}}%
847      \NewDocumentCommand\FB@partname{}{%
848          \iffFBPartNameFull
849              \csname ordinal\romannumeral\value{part}\endcsname\space
850              \partnameord\FB@emptypart
851          \else
852              Partie%
853          \fi}%
854      }
855  \SetString{\partname}{\FB@partname}
856 \EndBabelCommands

```

`\figurename` and `\tablename` are printed in small caps in French, unless either **SmallCapsFigTabCaptions** is set to **false** or a class or package loaded before `babel-french` defines `\FBfigtabshape` as `\relax`.

```
857 \providecommand*\FBfigtabshape{\scshape}
```

New command `\FBtocpartname` to help printing “Première partie” instead of “Partie I” in the Table of Contents. It takes a Roman numeral as argument (the part number), and returns a formatted string (“Première partie” if the argument is “I”), unless option `TocPartNameFull` is set to false. It is used currently used only with the `memoir` and `koma-script` classes.

```

858 \ExplSyntaxOn
859 \NewExpandableDocumentCommand\FBlower{m}
860 {
861     \str_lowercase:n {#1}
862 }
863 \ExplSyntaxOff
864 \newcommand*\FBtocpartsep{\protect\space}
865 \NewDocumentCommand\FBtocpartname{m}{%
866     \iffBToCPartNameFull
867         \csname ordinal\FBlower{#1}\endcsname\space
868         \partnameord \FBtocpartsep \FB@emptypart
869     \else
870         Partie%
871     \fi}%

```

2.8 Checks about packages' loading order

\FBWarning \FBWarning is an alias of \PackageWarning{french.ldf} which can be made silent by option **SuppressWarning**.

```
872 \newcommand{\FBWarning}[1]{\PackageWarning{french.ldf}{#1}}
```

Package `beamerarticle` should be loaded before `babel-french` to avoid list's conflicts, see p. 41.

```
873 \newif\if@FBwarning@beamerarticle
874 \IfPackageLoadedTF{beamerarticle}{}{\@FBwarning@beamerarticletrue}
875 \AddToHookNext{env/document/before}%
876   \if@FBwarning@beamerarticle
877     \IfPackageLoadedTF{beamerarticle}{}%
878       {\@FBwarning@beamerarticlefalse}%
879   \fi
880   \if@FBwarning@beamerarticle
881     \FBWarning{Please load the "beamerarticle" package\MessageBreak
882               BEFORE babel/french; reported}%
883   \fi
884 }
```

2.9 Setup options: key/value stuff (l3keys)

Check LaTeX2e version (support for l3keys required).

```
885 \NeedsTeXFormat{LaTeX2e}[2022-06-01]
```

If the new templates for lists and footnotes are available, `babel-french` will use them.

```
886 \newif\iffBnewlists
887 \newif\iffBnewfootnotes
888 \IfPackageLoadedTF{latex-lab-testphase-block}{\FBnewliststrue}{}%
889 \IfPackageLoadedTF{latex-lab-testphase-block}{\FBnewfootnotestrue}{}%
```

All setup options are handled by command \frenchsetup{} based on the l3keys' \SetKeys{} command. A list of flags is defined beforehand and set to default values which will possibly be changed 'AtEndOfPackage' in case French is the main language. After this, \frenchsetup{} eventually modifies the preset values of these flags.

Some options processing occurs in \frenchsetup{}, *only for options explicitly set by \frenchsetup{}*, the rest is done just before \begin{document}.

We first define a collection of conditionals for global layout. Their defaults values are chosen so that `babel-french` does not change anything regarding the global layout. Some of them will toggled 'AtEndofPackage' according to the main language, then they will all be checked again just before \begin{document} in \FBprocess@options to fit \frenchsetup{} specifications and changes required by packages loaded after Babel.

```

926   \fi
927 \fi

```

Some of the flags must be toggled when French is the main language. The latter (last option of Babel, stored in `\bbbl@main@language`) will be known ‘AtEndOfPackage’. So we postpone the `\bbbl@main@language` check until then.

Our list customisation conflicts with the `beamer` class and with the `beamerarticle` package. The patch provided in `beamerbasecompatibility` solves the conflict except in case of language changes, so we provide our own patch. When the `beamer` is loaded, lists are not customised at all to ensure compatibility. The `beamerarticle` package

needs to be loaded *before* Babel, a warning is issued otherwise, see section 2.8; a light customisation is compatible with the `beamerarticle` package.

```

928 \def\FB@french{french}
929 \newif\iffB@mainlanguage@FR

Just before `\begin{document}`, let's now process the remaining options, either not explicitly set by `\frenchsetup{}` or possibly modified by packages loaded after `babel-french`. We also have to provide an `\xspace` command in case the `xspace` package is not loaded. In some cases (package `standalone`, `dtk`, ...) several `\documentclass{}` commands are allowed, so use `\AddToHookNext` instead of `\AddToHook` (all instances) as our stuff should only added to the first occurrence of `\documentclass{}` anyway.

```

1370 \AddToHookNext{env/document/before}{%
1371   \providecommand*\xspace{\relax}%
1372   \FBprocess@options
1373 }

```

2.10 French lists

\listFB Vertical spacing in lists should be shorter in French texts than the defaults provided **\listORI** by LaTeX. Note that the easy way, just changing values of vertical spacing parameters **\FB@listVsettings** when entering French and restoring them to their defaults on exit would not work; so we define the command `\FB@listVsettings` to hold the settings to be used by the French variant `\listFB` of `\list`. Note that switching to `\listFB` reduces vertical spacing in *all* environments built on `\list`: `itemize`, `enumerate`, `description`, but also `abstract`, `quotation`, `quote` and `verse`...

The amount of vertical space before and after a list is given by `\topsep` + `\parskip` (+ `\partopsep` if the list starts a new paragraph). IMHO, `\parskip` should be added *only* when the list starts a new paragraph, so I subtract `\parskip` from `\topsep` and add it back to `\partopsep`; this will normally make no difference because `\parskip`'s default value is `0pt`, but will be noticeable when `\parskip` is *not* null.

```

1374 \let\listORI\list
1375 \let\endlistORI\endlist
1376 \newdimen\FB@pardim
1377 \def\FB@listVsettings{%
1378   \setlength{\topsep}{0.8ex plus 0.4ex minus 0.4ex}%
1379   \setlength{\partopsep}{0.4ex plus 0.2ex minus 0.2ex}%
1380   \setlength{\itemsep}{0.4ex plus 0.2ex minus 0.2ex}%
1381   \setlength{\parsep}{0.4ex plus 0.2ex minus 0.2ex}%
}

```

`\parskip` is of type ‘skip’, its mean value only (*not the glue*) should be subtracted from `\topsep` and added to `\partopsep`, so convert `\parskip` to a ‘dimen’ using `\FB@pardim`.

```
1382 \FB@pardim=\parskip
```

If `\parskip` is not null, `\parsep` is set to `\parskip`, so paragraphs inside items will be preceded by the same vertical space as paragraphs located outside lists; the vertical skip before items (`\itemsep + \parsep`) doesn't need to be enlarged.

```

1383     \ifdim\FB@pardim>\z@
1384         \addtolength{\topsep}{-\FB@pardim}%
1385         \addtolength{\partopsep}{\FB@pardim}%
1386         \setlength{\parsep}{\FB@pardim}%
1387         \addtolength{\itemsep}{-\FB@pardim}%
1388     \fi
1389 }
1390 \def\listFB#1#2{\listORI{#1}{\FB@listVsettings #2}}
1391 \let\endlistFB\endlistORI

```

Let's now consider French itemize-lists. They differ from those provided by the standard LaTeX classes:

- The ‘•’ is never used in French itemize-lists, an emdash ‘—’ or an endash ‘–’ is preferred for all levels. The item label to be used in French, stored in `\FrenchLabelItem`, defaults to ‘—’ and can be changed using `\frenchsetup{}` (see section 2.9).
- Vertical spacing between items, before and after the list, should be *null* with *no glue* added;
- In French the labels of itemize-lists are vertically aligned as shown p. 6.

\FrenchLabelItem Default labels for French itemize-lists —same label for all levels—, (already defined as `\Frlabelitemi` empty by `\DeclareKey{}`):

```

\Frlabelitemii 1392 \renewcommand*{\FrenchLabelItem}{\textemdash}
\Frlabelitemiii 1393 \renewcommand*{\Frlabelitemi}{\FrenchLabelItem}
\Frlabelitemiv 1394 \renewcommand*{\Frlabelitemii}{\FrenchLabelItem}
1395 \renewcommand*{\Frlabelitemiii}{\FrenchLabelItem}
1396 \renewcommand*{\Frlabelitemiv}{\FrenchLabelItem}

```

\listindentFB Let's define four dimens `\listindentFB`, `\descindentFB`, `\labelindentFB` and `\labelwidthFB` to customise lists' horizontal indentations. They are given silly negative values here in order to eventually enable their customisation in the preamble. They will get reasonable defaults later when entering French (see below `\setlistindentFB` and `\setlabelitemsFB`) unless they have been customised before.

```

1397 \newdimen\listindentFB
1398 \setlength{\listindentFB}{-1pt}
1399 \newdimen\descindentFB
1400 \setlength{\descindentFB}{-1pt}
1401 \newdimen\labelindentFB
1402 \setlength{\labelindentFB}{-1pt}

```

```

1403 \newdimen\labelwidthFB
1404 \setlength{\labelwidthFB}{-1pt}

```

The next function will be included in `\update@frenchlists` which is executed in `\extrasfrench{}` ‘AtBeginDocument’.

```

1405 \def\setlistindentFB{%
1406   \ifdim\labelindentFB<\z@
1407     \ifdim\parindent=\z@
1408       \setlength{\labelindentFB}{1.5em}%
1409     \else
1410       \setlength{\labelindentFB}{\parindent}%
1411     \fi
1412   \fi
1413   \ifdim\listindentFB<\z@
1414     \ifdim\parindent=\z@
1415       \setlength{\listindentFB}{1.5em}%
1416     \else
1417       \setlength{\listindentFB}{\parindent}%
1418     \fi
1419   \fi

1422       \setlength{\descindentFB}{\labelindentFB}%
1423     \else
1424       \setlength{\descindentFB}{\listindentFB}%
1425     \fi
1426   \fi
1427 }

```

`\leftmarginFB` `\FB@listHsettings` holds the new horizontal settings chosen for French lists `itemize`, `\FB@listHsettings` `enumerate` and `description` (two possible layouts).

```

1428 \newdimen\leftmarginFB
1429 \def\FB@listHsettings{%
1430   \ifFBListItemsAsPar

```

Optional layout: lists' items are typeset as paragraphs with indented labels.

```

1431   \itemindent=\labelindentFB
1432   \advance\itemindent by \labelwidthFB
1433   \advance\itemindent by \labelsep
1434   \leftmargini\z@
1435   \bb@for\FB@dp {2, 3, 4, 5, 6}%
1436     {\csname leftmargin\romannumeral\FB@dp\endcsname =
1437      \labelindentFB}%
1438   \else

```

Default layout: labels hanging into the list left margin.

```

1439   \leftmarginFB=\labelwidthFB

```

```

1440   \advance\leftmarginFB by \labelsep
1441   \bb@for\FB@dp {1, 2, 3, 4, 5, 6}%
1442     {\csname leftmargin\romannumeral\FB@dp\endcsname =
1443      \leftmarginFB}%
1444   \advance\leftmargini by \listindentFB
Same 'parindent' for paragraphs in lists' items (was null as in standard lists).
1445   \listparindent=\parindent
1446   \fi
1447   \leftmargin=\csname leftmargin%
1448   \ifnum\@listdepth=\@ne i\else ii\fi\endcsname
1449 }

```

\itemizeFB New environment for French itemize-lists.

\FB@itemizesettings **\FB@itemizesettings** does two things: first suppress all vertical spaces including glue unless option **StandardListSpacing** is set, then set horizontal indentations according to **\FB@listHsettings**.

```

1450 \def\FB@itemizesettings{%
1451   \iffBStandardListSpacing
1452   \else
1453     \FB@pardim=\parskip
1454     \ifdim\FB@pardim>\z@
1455       \setlength{\topsep}{-\FB@pardim}%
1456       \setlength{\partopsep}{\FB@pardim}%
1457       \setlength{\parsep}{\FB@pardim}%
1458       \setlength{\itemsep}{-\FB@pardim}%
1459     \else
1460       \setlength{\topsep}{\z@}%
1461       \setlength{\partopsep}{\z@}%
1462       \setlength{\parsep}{\z@}%
1463       \setlength{\itemsep}{\z@}%
1464     \fi
1465   \fi
1466   \settowidth{\labelwidth}{\csname\@itemitem\endcsname}%
1467   \FB@listHsettings
1468 }

```

The definition of **\itemizeFB** follows the one of **\itemize** in standard LaTeX classes (see **ltlists.dtx**), spaces are customised by **\FB@itemizesettings**.

```

1469 \def\itemizeFB{%
1470   \ifnum \@itemdepth >\thr@@\@toodeep\else
1471     \advance\@itemdepth by \@ne
1472     \edef\@itemitem{\labelitem\romannumeral\the\@itemdepth}%
1473     \expandafter
1474     \listORI
1475     \csname\@itemitem\endcsname
1476     \FB@itemizesettings

```

```

1477     \fi
1478 }
1479 \let\enditemizeFB\endlistORI

```

The next function will be included in `\update@frenchlists` which is executed in `\extrasfrench{}` ‘AtBeginDocument’.

```

1480 \def\setlabelitemsFB{%
1481   \let\labelitemi\rlabelitemi
1482   \let\labelitemii\rlabelitemii
1483   \let\labelitemiii\rlabelitemiii
1484   \let\labelitemiv\rlabelitemiv
1485   \ifdim\labelwidthFB<\z@
1486     \settowidth{\labelwidthFB}{\FrenchLabelItem}%
1487   \fi
1488 }

```

\enumerateFB The definition of `\enumerateFB`, new to version 2.6a, follows the one of `\enumerate` in standard LaTeX classes (see `ltlists.dtx`), vertical spaces are customised (or not) via `\list` (`=\listFB` or `\listORI`) and horizontal spaces (`leftmargins`) are borrowed from `itemize` lists via `\FB@listHsettings`.

```

1489 \def\enumerateFB{%
1490   \ifnum \@enumdepth > \thr@@ \@toodeep \else
1491     \advance\@enumdepth by \@ne
1492     \edef\@enumctr{enum\romannumeral\the\@enumdepth}%
1493     \expandafter
1494     \list
1495       \csname label\@enumctr\endcsname
1496       {\FB@listHsettings
1497        \usecounter\@enumctr\def\makelabel##1{\hss\llap{##1}}}%}
1498   \fi
1499 }
1500 \let\endenumerateFB\endlistORI

```

\descriptionFB Same tuning for the `description` environment (see `classes.dtx` for the original definition). Customisable dimen `\descindentFB`, which defaults to `\listindentFB`, is added to `\itemindent` (first level only). When `\descindentFB=0pt` (1rst level labels start at the left margin), `\leftmargini` is reduced to `\listindentFB` instead of `\listindentFB + \leftmarginFB`.

When option `ListItemsAsPar` is turned to `true`, the `description` items are also displayed as paragraphs; `\descindentFB=0pt` can be used to push labels to the left margin.

```

1501 \def\descriptionFB{%
1502   \list{}{\FB@listHsettings
1503     \labelwidth=\z@
1504     \ifFBListItemsAsPar

1533 }

```

Nothing has to be done at language's switches regarding lists, except at the first switch in case French is the main language, then lists are updated once for all. There is nothing to do for lists in \noextrasfrench.

Lists' layout no longer changes at language switches.

```

1534 \def\bbl@frenchlistlayout{%
1535   \iffB@mainlanguage@FR
1536   \iffBnewlists
1537   \else
1538     \update@legacylists
1539     \let\update@legacylists\relax
1540   \fi
1541 \fi}
1542 \addto\extrasfrench{\bbl@frenchlistlayout}

```

2.11 French indentation of sections

\bbbl@frenchindent In French the first paragraph of each section should be indented, this is another difference with US-English. This is controlled by the flag `\if@afterindent`.

Indentation changes at language switches in only if `IndentFirst=true` and French isn't the main language.

```
1543 \def\bbbl@frenchindent{%
1544   \iffBIndentFirst
1545     \ifFB@mainlanguage@FR\else\babel@save\@afterindentfalse\fi
1546     \let\@afterindentfalse\@afterindenttrue
1547     \@afterindenttrue
1548   \fi}
1549 \addto\extrasfrench{\bbbl@frenchindent}
```

2.12 Formatting footnotes

The layout of footnotes is controlled by two flags `\iffBAutoSpaceFootnotes` and `\iffBFrenchFootnotes` which are set by options of `\frenchsetup{}` (see section 2.9). The layout of footnotes *does not depend* on the current language (just think of two footnotes on the same page looking different because one was called in a French part, the other one in English!).

Common settings for both new and old footnote's code:

\parindentFFN The value of `\parindentFFN` will be redefined at the `\begin{document}`, as the maximum of `\parindent` and `1.8em` unless it has been set in the preamble (the weird value `\kernFFN 10in` is just for testing whether `\parindentFFN` has been set or not).

```
1550 \newdimen\parindentFFN
1551 \parindentFFN=\maxdimen
```

`\FBfnindent` will be set later on to the width of the box holding the footnote mark, `\dotFFN` and `\kernFFN` (flushed right). It is used by `memoir` and `koma-script` classes.

```
1552 \newdimen\FBfnindent
1553 \newcommand*\dotFFN{.}
1554 \newcommand*\kernFFN{\kern .5em}
```

\FBfnmarkspace Let's define a customisable thin space which will be added before footnote's call.

```
1555 \newcommand*\FBfnmarkspace{\kern .5\fontdimen2\font}
```

\newfootnotemarkFB This code is for the new footnotes templates.

```
1556 \newcommand*\newfootnotemarkFB{%
1557   \setbox\tempboxa\hbox{\@thefnmark}%
1558   \ifdim\wd\tempboxa>\z@
1559     \llap{\@thefnmark}\dotFFN\kernFFN
1560   \fi}
```

This code is for legacy footnotes:

\@makefntextFB We define `\@makefntextFB`, a variant of `\@makefntext` which is responsible for the layout of footnotes, to match the specifications of the French ‘Imprimerie Nationale’: footnotes will be indented by `\parindentFFN`, numbers (if any) typeset on the baseline (instead of superscripts), right aligned on `\parindentFFN` and followed by a dot and an half quad kern. Whenever symbols are used to number footnotes (as in `\thanks` for instance), we switch back to the standard layout (the French layout of footnotes is meant for footnotes numbered by arabic or roman digits).

`\@makefntextFB`’s definition depends on the document’s class.

Koma-script classes: they provide `\deffootnote`, a handy command to customise the footnotes’ layout (see English manual `scrguien.pdf`); it redefines `\@makefntext` and `\@@makefnmark`. First, save the original definitions.

```
1561 \iffB@koma
1562   \let\@makefntextORI\@makefntext
1563   \let\@makefnmarkORI\@@makefnmark
```

`\@makefntextFB` and `\@@makefnmarkFB` are used when option **FrenchFootnotes** is **true**.

```
1564 \deffootnote[\FBfnindent]{\z@}{\parindentFFN}%
1565           {\thefootnotemark\dotFFN\kernFFN}
1566 \let\@makefntextFB\@makefntext
1567 \let\@makefnmarkFB\@@makefnmark
```

`\@makefntextTH` and `\@@makefnmarkTH` are meant for the `\thanks` command used by `\maketitle` when **FrenchFootnotes** is **true**.

```
1568 \deffootnote[\parindentFFN]{\z@}{\parindentFFN}%
1569           {\textsuperscript{\thefootnotemark}}
1570 \let\@makefntextTH\@makefntext
1571 \let\@makefnmarkTH\@@makefnmark
```

Restore the original definitions.

```
1572 \let\@makefntext\@makefntextORI
1573 \let\@makefnmark\@@makefnmarkORI
1574 \fi
```

Definitions for the `memoir` class:

```
1575 \@ifclassloaded{memoir}
(see original definition in memman.pdf)
```

```
1576 {\newcommand{\@makefntextFB}[1]{%
1577   \def\footscript##1##1{\dotFFN\kernFFN}%

1579   \setlength{\footmarksep}{-\footmarkwidth}%
1580   \setlength{\footparindent}{\parindentFFN}%
1581   \makefootmark #1}%
1582 }{}}
```

Definitions for the `beamer` class:

the original definition is in `beamerbaseframecomponents.sty`, note that for the `beamer` class footnotes are LR-boxes, not paragraphs, so `\parindentFFN` is irrelevant.

```

1583 \@ifclassloaded{beamer}
1584   {\def\@makefntextFB#1{%
1585     \def\insertfootnotetext{\#1}%
1586     \def\insertfootnotemark{\insertfootnotemarkFB}%
1587     \usebeamertemplate***{footnote}}%
1588   \def\insertfootnotemarkFB{%
1589     \usebeamercolor[fg]{footnote mark}%
1590     \usebeamertfont*{footnote mark}%
1591     \llap{\@thefnmark}\dotFFN\kernFFN}%
1592 }{}}
```

Now the default definition of `\@makefntextFB` for standard LaTeX and AMS classes. The next command prints the footnote mark according to the specifications of the French ‘Imprimerie Nationale’. Keep in mind that `\@thefnmark` might be empty (i.e. in AMS classes’ titles)!

```

1593 \providetcommand*\@insertfootnotemarkFB{%
1594   \parindent=\parindentFFN
1595   \rule{z@\footnotesep}
1596   \setbox\@tempboxa\hbox{\@thefnmark}%
1597   \ifdim\wd\@tempboxa>z@
1598     \llap{\@thefnmark}\dotFFN\kernFFN
1599   \fi}
1600 \providetcommand\@makefntextFB[1]{\insertfootnotemarkFB #1}
```

The rest of `\@makefntext`’s customisation will be done at the `\begin{document}`: saving the original definition of `\@makefntext`, then redefining `\@makefntext` according to the value of flag `\ifFBFrenchFootnotes` (true or false).

\@footnotemark We will save the original definition of `\@footnotemark` at `\begin{document}` in order to include any customisation that packages might have done; we define a variant `\@footnotemarkFB` which just adds a (customisable) thin space before the number or symbol calling a footnote (any space typed in is removed first). The choice between the two definitions (valid for the whole document) is controlled by flag `\ifFBAutoSpaceFootnotes`.

`\@footnotemark`’s customisation: `\FBfnmarkspace` will be added before footnote’s call by `\@footnotemarkFB`.

```

1601 \def\@footnotemarkFB{\leavevmode\unskip\unkern
1602                               \protect\FBfnmarkspace\@footnotemarkORI}%
```

The following command `\FBlegacyfootnote@switch` gathers the code needed to switch between French or Standard layout for footnotes; it is processed in `\FBprocess@options` just before `\begin{document}`.

The LuaTeX command `\localleftbox` and `\FBeverypar@quote` used by `\frquote{}` have to be reset inside footnotes; done for LaTeX based formats only.

```
1603 \newcommand*{\FBlegacyfootnote@switch}{%
```

When the `footnotebackref` package is loaded, `babel-french` will not customise `\@footnotetext` in order to keep back referencing working.

```
1604 \IfPackageLoadedTF{footnotebackref}{%
1605   {\FBFrenchFootnotesfalse
1606   \FBWarning
1607     {footnotebackref package loaded.\MessageBreak
1608       babel-french will NOT customise footnotes;%
1609       \MessageBreak reported}}%
1610 {}%
```

The `bigfoot` package deeply changes the way footnotes are handled. When `bigfoot` is loaded, we just warn the user that `babel-french` will not customise footnotes at all.

```
1611 \IfPackageLoadedTF{bigfoot}{%
1612   {\FBWarning
1613     {bigfoot package in use.\MessageBreak
1614       babel-french will NOT customise footnotes;%
1615       \MessageBreak reported}}%
```

Otherwise, footnotes may be customised according to the `\frenchsetup{}` options.

```
1616 {\let\@footnotemarkORI\@footnotemark
1617 \ifFBAutoSpaceFootnotes
1618   \let\@footnotemark\@footnotemarkFB
1619   \fi
1620   \ifdim\parindentFFN<\maxdimen
1621   \else
1622     \parindentFFN=\parindent
1623     \ifdim\parindentFFN<1.5em \parindentFFN=1.5em \fi
1624   \fi
1625   \settowidth{\FBfnindent}{\dotFFN\kernFFN}%
1626   \addtolength{\FBfnindent}{\parindentFFN}%
1627   \let\@makefntextORI\@makefntext
```

Koma-script classes require a special treatment.

Definition of `\@makefntext` for koma-script classes: running `makefntextORI` inside a group to reset `\localleftbox{}` and `\FBeverypar@quote` would mess up the layout of footnotes whenever the first mandatory argument of `\deffootnote{}` (used as `\leftskip`) is non-nil (default is 1em, 0pt in French).

```
1628 \iffB@koma
1629   \let\@@makefnmarkORI\@@makefnmark
1630   \long\def\@makefntext##1{%
1631     \localleftbox{}%
1632     \let\FBeverypar@save\FBeverypar@quote
1633     \let\FBeverypar@quote\relax
1634     \iffBFrenchFootnotes
1635       \ifx\footnote\thanks
```

```

1636          \let\@@makefnmark\@@makefnmarkTH
1637          \@@makefntextTH{\##1}
1638      \else
1639          \let\@@makefnmark\@@makefnmarkFB
1640          \@@makefntextFB{\##1}

1663          \fi
1664      }{}%

```

Definition of `\@makefntext` for all other classes:

```

1665      \long\def\@makefntext{\#1}%
1666          \localleftbox{}%
1667          \let\FBeverypar@save\FBeverypar@quote
1668          \let\FBeverypar@quote\relax
1669          \ifFBFrenchFootnotes
1670              \@@makefntextFB{\##1}%
1671          \else
1672              \@@makefntextORI{\##1}%
1673          \fi
1674          \let\FBeverypar@quote\FBeverypar@save
1675          \localleftbox{\FBeverypar@quote}%

```

```

1676      \fi
Revert to standard footnotes inside minipages.
1677      \AddToHook{env/minipage/begin}[frenchb]{\FBFrenchFootnotesfalse}
1678  }
1679 }

\FBlegacyfootnote@switch is executed when entering French for the first time (at
\begin{document}), after possible redefinitions made by latex-lab for tagging.

1680 \def\bbbl@frenchfootnotes{%
1681   \ifFB@mainlanguage@FR
1682     \ifFBnewfootnotes
1683     \else
1684       \FBlegacyfootnote@switch
1685       \let\FBlegacyfootnote@switch\relax
1686     \fi
1687   \fi}
1688 \addto\extrasfrench{\bbbl@frenchfootnotes}

```

2.13 Clean up and exit

Final cleaning. The macro `\ldf@finish` takes care for setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value. `\loadlocalcfg` is redefined locally in order not to load any `.cfg` file for French.

```

1689 \FBclean@on@exit
1690 \ldf@finish\CurrentOption
1691 \let\loadlocalcfg\FB@llc
1692 </french>

```

3 Change History

Changes listed in reverse order (latest first) since v3.3.

v4.0e	General: \AddToHook for env/document/ replaced by \AddToHookNext (all instances).	53	v3.7a	General: Support for acadian dropped. The files acadian.ldf, canadien.ldf, frenchb.ldf and francais.ldf load french.ldf and print a warning.	64
v4.0d	General: \FBprocess@options must be processed only once, reported by Herbert Voß for dtk.cls.	53	\frquote: Flag \ifFBcloseguill does not apply to \@fgii.	29	
v4.0c	General: \StandardFootnotes and \FrenchFootnotes commands removed.	64	v3.6b	\NoAutoSpacing: \NoAutoSpacing must be inhibited in bookmarks.	28
v4.0b	General: \FBlegacyfootnote@switch moved to \extrasfrench (tagging issue).	64	v3.6a	\@footnotemark: Allow customisation of the space added in \@footnotemarkFB.	61
	New \ifFBnewlists and \iffBnewfootnotes to handle the new corresponding templates.	40	v3.5s	frenchb.lua: A ‘:’ followed by ‘-’ or a ligature should not trigger spacing.	22
	\FBprocess@options: New code to customise footnotes when the new templates are available.	48	v3.5q	\listFB: Bug correction: \parsep should be related to \parskip and \listparindent to \parindent.	53
v4.0a	General: New customisation for the Part entries in the toc. Suggested by Julien Labb��.	39	v3.5p	\DecimalMathComma: \DecimalMathComma can again be used in the preamble for a global action. It now works as expected inside a group.	35
	Option CustomiseFigTabCaptions is set to false.	40	v3.5o	frenchb.lua: Opening guill.: look ahead when next is a penalty (nobreak space).	24
	Options og and fg are now useless.	40	v3.5k	\bsc: \bsc now relies on \texorpdfstring to be safe in bookmarks.	34
	Removed obsolete compatibility options GlobalLayoutFrench, ListOldLayout, OldFigTabCaption	40	v3.5h	frenchb.lua: Added glues and penalties should inherit attributes from the related punctuation character; this is mandatory for Lua-UL to underline and highlight	
	frenchb.lua: Codes 0x2039 and 0x203A added for French single quotes.	18			
	New function 'euphonic_t' for hyphenation of compound words. Suggested by Thomas Savary.	26			
	Take non null values of \spaceskip into account. Bug pointed out by Enrico Gregorio.	20			

them. Thanks to Marcel Krüger for providing the fix.	21	paragraphs with indented labels while the default leaves the labels hanging into the left margin.	55
v3.5g			
frenchb.lua: The kerning callback is a bit specific: adding code with add_to_callback actually deletes the legacy kerning as pointed out by Marcel Krüger on SE.	21		
v3.5c			
General: Remove grouping inside \@makefntext, \localleftbox and \FBeverypar@quote saved and restored instead.	61		
v3.5b			
General: Reset \FBeverypar@quote locally inside \@makefntext. Needed by \frquote.	61		
v3.5a			
General: New optional layout for lists: lists' items can be typeset as			
v3.4a			
General: Shrink/stretch removed in \FBthousandsep.	38		
v3.3d			
frenchb.lua: In default mode, for ':' only, check if next node is a glyph or not. If it is, turn the 'auto' flag to false (avoids spurious spaces in URLs, MSDOS paths or 10:35).	22		
v3.3c			
General: New command \FBthousandsep to customise numprint.	38		
		Reset \localleftbox locally inside \@makefntext. Needed by \frquote with LuaTeX.	61
